MS2602A

100 Hz to 8.5 GHz

The MS2602A is a modern high-performance spectrum analyzer. It has been designed to meet the needs of a new era of expanded use of frequencies in the quasi-microwave band and the trend toward higher performance and more digitized radio equipment.

The MS2602A covers frequencies between 100 Hz to 8.5 GHz, and can analyze frequencies up to three to five times the higher harmonics range of domestic digital cordless telephones (1.9 GHz), digital car phones and portable phones (1.5 GHz) and private mobile telephones (1.5 GHz). The MS2602A has a high signal purity (C/N –120 dBc/Hz, 100 kHz offset) and low distortion (–100 dBc, 850 MHz minimum) and can accurately measure high performance radio equipment and electronic parts over a wide dynamic range. Time domain and burst measurement functions allow analysis of various burst signals, including time division multiplex (TDM) digital radio communication systems. Adjacent channel leakage power and other high-speed analysis functions for evaluating the performance of radio equipment are provided as standard.

An optional PTA function, which allows the test method for each application to be freely programmed, is also available.

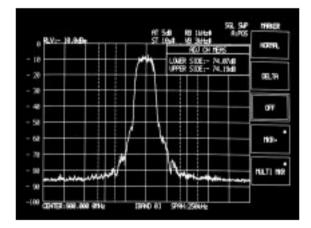

Features

- High C/N, low distortion, high accuracy
- Time domain measurement (high speed, high resolution, pre-trigger function)
- Dual-display mode (frequency domain/time domain, foreground/background)
- Many marker functions (zone marker, multi-marker, etc.)
- FM demodulated waveform display
- PTA (Personal Test Automation: option)

Quality basic function

• High Č/N

The excellent low wideband noise level (-120 dBc/Hz or better, 100 kHz offset) of the MS2602A is more than enough to measure the adjacent channel leakage power of digital mobile communication equipment. This is essential to cope with the widening of the communication channel bandwidth by digitization.

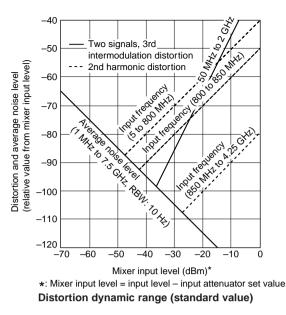

Adjacent channel leakage power measurement

• Low distortion characteristics

Second harmonic distortion: The MS2602A has a wide dynamic range with a second harmonic distortion of only -100 dBc for signals over 850 MHz.

-100 dBc (mixer input level -20 dBm, frequency 0.85 to 4.25 GHz) **Two signals, 3rd intermodulation distortion:** The superior intermodulation distortion of the MS2602A is perfect for nonlinear evaluation of such devices as high-power amplifiers. (-85 dBc: mixer input level -30 dBm, 50 kHz separation)

/inritsu

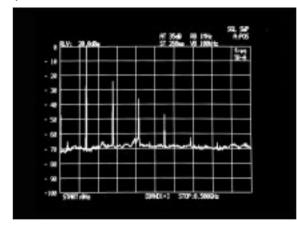

• High accuracy

The MS2602A provides highly accurate measurement of level and span. Its excellent reference level accuracy and amplitude frequency characteristics allow measurements up to 2.0 GHz with an accuracy of \pm 1.1 dB (total level accuracy). Calibration is performed automatically from a precision internal calibration signal source. When measuring the occupied bandwidth, the span accuracy of the spectrum analyzer has a large influence on measurement accuracy. The span accuracy of the MS2602A is a high \pm 2.5%. The number of sampling points on the horizontal axis can be selected as either 501 or 1002 points, depending on the application.

• Linear spectrum analysis

Because the MS2602A uses an analog horizontal sweep signal, it accurately traces the linear spectrum and can accurately measure the level of fine linear peaks, such as spurious signals, without any vertical jitter.

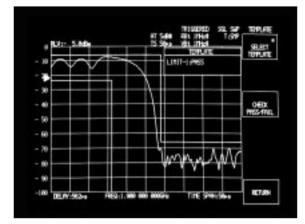

0 to 8.5 GHz band continuous sweep waveform

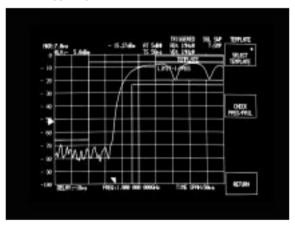

Enhanced burst signal analysis function

• Time domain measurements

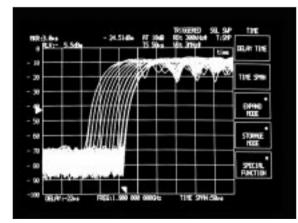

High-speed, high resolution: High-speed sweep of 5 μ s/div allows accurate measurement of the rising/falling edge times (10.4 μ s) of digital cordless telephone burst signals. A high-speed 10-bit A/D converter permits high accuracy template (limit line) comparison measurement at a vertical axis resolution of 0.1 dB at 10 dB/div.

Standard pre-trigger function: The pre-trigger function displays the waveforms before the trigger point (one screen) and allows the rising/ falling edge times of burst signals to be measured accurately. An internal video trigger allows stable pre-trigger operation without an external trigger signal.

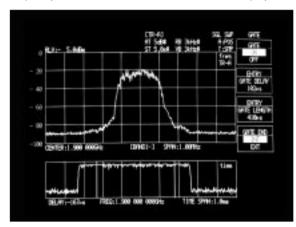

Overwrite display function: The convenient overwrite display function lets you monitor changes in the rising/falling edge characteristics of burst analysis waveforms.

/inritsu

• Burst spectrum measurements

The gate width can be set with the cursor while viewing time domain burst waveforms. The gate width can also be set in the time domain mode while observing the spectrum after the gate by displaying both the frequency domain and time domain on the dual display.

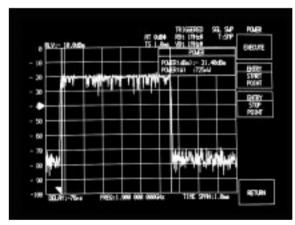

Radio equipment evaluation functions are standard features

• Simple measurement of official standards

The MS2602A simplifies such complicated measurements as average burst signal power, adjacent channel leakage power, occupied bandwidth, and burst rising/falling edge time template comparison measurement. High-speed processing displays the measured result in 0.8 seconds (processing time).

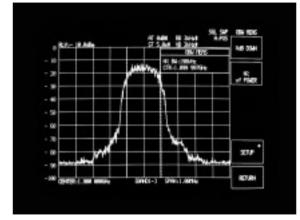

Average burst power measurement

The burst signal power is measured by separating it into on and off power period. The MS2602A uses time domain measurement to measure the average power of the selected zone by the marker.

Occupied bandwidth measurement

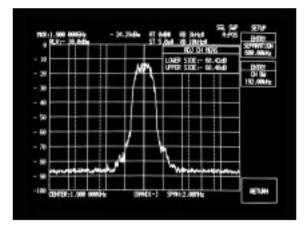

High span width accuracy permits the occupied bandwidth to be accurately measured. The occupied bandwidth can be measured by the percent method or X dB method. The measurement center frequency is simultaneously displayed.

Adjacent channel leakage power measurements

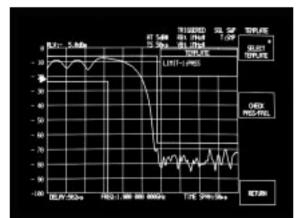

The channel separation of digital mobile communications equipment is wide and requires a high C/N over a wide frequency range of fifty to several hundred kilohertz.

The MS2602A uses a high purity local oscillator to realize a high C/N and wide dynamic range. The channel separation and bandwidth parameters of the adjacent channel leakage power measurement can be freely set.

• Template (limit line) comparison measurement

The rising/failing edge of burst waveform with template comparison measurements can be performed and GO/NO-GO decisions can be made. Up to two upper and lower limit lines can be set on one template. For instance, up to five official standards and in-house standards can be set and stored.

Specifications

	Frequency range	100 Hz to 8.5 GHz			
Frequency	Frequency band structure	Band 0 (0 to 2 GHz), band 1– (1.7 to 7.5 GHz), band 1+ (6.5 to 8.5 GHz)			
	Pre-selector frequency range	1.7 to 8.5 GHz			
	Frequency setting	Range: 100 Hz to 8.5 GHz (band 1–, 1+) Mode: CENTER-SPAN, START-SPAN, START-STOP Resolution: 1 Hz			
	Frequency accuracy	Frequency display Resolution: 1/1000 digit of span (min. 1 Hz), fractions are rounded. Accuracy:±(display frequency x reference frequency accuracy + span x span accuracy) Marker frequency Resolution: 0.2% of span, fractions are rounded. Accuracy: same as display frequency accuracy (NORMAL), same as span accuracy (DELTA)			
	Frequency measurement*1	Resolution: 1 Hz, 10 Hz, 100 Hz, 1 kHz Accuracy: Display frequency x reference frequency accuracy ±1 count (S/N ≥20 dB)			
	Span	Setting range: 0 Hz, 100 Hz to 8.5 GHz Setting resolution: Ten-key/data knob: 3-digit value (100 to 999), step key: 1-2-5 sequence Accuracy: ±2.5% (span ≥1 kHz), ±5% (100 Hz ≤ span <1 kHz)			
	Resolution bandwidth	Setting range: 10 Hz to 3 MHz (3 dB), 1-3 sequence (can be set manually, or automatically according to frequency span) Accuracy: ±20% Selectivity (60dB/3dB): ≤15:1 (100 kHz to 3 MHz), ≤12:1 (10 Hz to 30 kHz)			
	Video bandwidth	1 Hz to 3 MHz, 1-3 sequence (can be set manually, or automatically according to resolution bandwidth), OFF			
	Signal purity and stability	Sideband noise: ≤–105 dBc/Hz (10 kHz offset), ≤–115 dBc/Hz (50 kHz offset), ≤–120 dBc/Hz (100 kHz offset) at frequency of 1 MHz to 4 GHz Power spurious: ≤–60 dBc (frequency; ≤1 GHz, offset; <360 Hz), ≤–70 dBc (frequency; ≤1 GHz, offset; ≥360 Hz) Residual FM: ≤2 Hzp-p/0.1 s (frequency; ≤1 GHz, spar; 0 Hz) Frequency drift: ≤20 Hz/min (span; ≤1 kHz), ≤200 Hz/min (span; ≤10 kHz) *After 1-hour warm-up at constant ambient temperature			
	Reference oscillator	Frequency: 10 MHz Start-up characteristics: ≤5 x 10-*(after 10-minute warm-up, compared to the frequency after 24-hour warm-up) Option 01: ≤2 x 10-*(after 30-minute warm-up, compared to the frequency after 24-hour warm-up) Aging rate: ≤2 x 10-*(day (option 01: ≤5 x 10-*/day), ≤1 x 10-7/year (option 01: ≤5 x 10-*/year) *Compared to the frequency after 24-hour warm-up Temperature characteristics: ±5 x 10-*(0° to 50°C), (option 01: ±3 x 10-*, 0° to 50°C) *Relative to the frequency at 25°C			
Amplitude	Level measurement	Measurement range: Average noise level to +30 dBm Maximum input: Average CW power: +30 dBm (input ATT; ≥5 dB), DC power: 0 Vdc Average noise level: ≤-135 dBm (1 MHz to 1.7 GHz), ≤-135 dBm (1.7 to 7.5 GHz), ≤-130 dBm (7.5 to 8.5 GHz) *At resolution bandwidth of 10 Hz, video bandwidth of 1 Hz, and input ATT of 0 dB Residual response: ≤-100 dBm (1 MHz to 8.5 GHz, input ATT; 0 dB)

S	Local leak	≤–50 dBm (at input ATT of 0 dB)			
Others	Interference radiation	≤20 dBµV *Can be measured on front panel using MA2601B EMI Probe, except horizontal synchronous signal (who number multiples of 25 kHz)			
	Signal search	AUTO TUNE, PEAK-CF, PEAK-REF, SCROLL			
	Zone marker	NORMAL, DELTA			
	Marker	$MARKER \rightarrow CF, MARKER \rightarrow REF, MARKER \rightarrow CF STEP SIZE, \vartriangle MARKER \rightarrow SPAN, ZONE \rightarrow SPAN$			
	Peak search	PEAK, NEXT PEAK, NEXT RIGHT PEAK, NEXT LEFT PEAK, MIN DIP, NEXT DIP			
	Multi-markers	HIGHEST 10, HARMONICS, MANUAL SET			
	Measure (operation)	Noise level (dBm/Hz, dBm/ch), C/N (dBc/Hz, dBc/ch), occupied bandwidth measurement, adjacent channel leakage power measurement, template (limit line) comparison measurement			
	External memory	Equipped with a slot for memory card (PMC)			
s S	Saving/recalling	Can save and recall setting conditions and measured waveform data in internal memory (4 sets) and external memory (PMC) Can save max. 11 data (setting conditions and measured waveform data) in PMC (32 KB)			
ction	Direct plotting	Can plot CRT information to the specified plotters or printers via GPIB 2			
Functions	PTA (Option 04)	Language: PTL (high level language interpreter based on BASIC) Programming: Built-in CRT editor for use with external keyboard Program storage: Can store PTA program in PMC Up-load and down-load functions are also provided by host computer Program memory: 192 KB (including fluent area) Data processing: Can directly access to measurement data as system variables using system functions and system subroutine			
	External control	 GPIB 1 (IEEE488.2): Can be controlled by external controller as standard device All panel functions except power switch and intensity knob can be controlled. SH1, AH1, T6, L4, SR1, RL1, PP0, DC1, DT1, C0 (Option 04/05: C1, C2, C3, C24) GPIB 2 (IEEE488.1): As controller, can control external device. SH1, AH1, T6, L4, SR0, RL0, PP0, DC0, DT0, C1, C2, C3, C28 RS-232C (Option 02): Changes GPIB 2 to RS-232C I/O port (Option 03): Changes GPIB 2 to I/O port, controls external device equipped with parallel I/O interface by PTA 			
Power		85 to 132 Vac/170 to 250 Vac, 47.5 to 63 Hz, ≤300 VA			
Operating temperature range		0° to 50°C			
Dimensions and mass		426 (W) x 177 (H) x 451 (D) mm, ≤22 kg (typical value: 20 kg)			
EMC	2*4	EN55011: 1991, Group 1, Class A EN50082-1: 1992			

/inritsu

The specifications applies to system setting, auto-sweep time, and normal function (SLOW).

*1: Counts received frequency of peak point within zone marker
*2: Total level accuracy: reference level accuracy (0 to -50 dBm) + frequency response + LOG linearity (0 to -20 dB) + calibration signal accuracy
*3: Mixer input level (dBm): input level (dBm) – input ATT (dB)
*4: Electromagnetic Compatibility
