This manual provides documentation for the following instruments:

**ESA-E Series**

E4402B (9 kHz - 3.0 GHz)  
E4404B (9 kHz - 6.7 GHz)  
E4405B (9 kHz - 13.2 GHz)  
E4407B (9 kHz - 26.5 GHz)

# Contents

1. **Introduction to GSM and EDGE**
   - What does the GSM/EDGE Measurement Personality and Hardware Do? .................. 38
   - Other Sources Of Measurement Information ................................................. 40
     - Application Notes .................................................................................. 40
     - Additional Information ........................................................................ 40
     - Updating the Firmware ......................................................................... 40
   - Installing Optional Measurement Personalities ......................................... 41
     - Activate License Key ............................................................................ 41
     - Installing the License Key ................................................................... 41
     - Using Install Key .................................................................................. 42
   - Installer Screen and Menu ........................................................................ 45
   - Options Required ....................................................................................... 47
2. **Making Measurements**
   - Preparing To Make Measurements .............................................................. 51
     - Initial settings ....................................................................................... 51
   - Making A Measurement ............................................................................ 51
   - Saving Measurement Results ................................................................... 53
   - GMSK Output RF Spectrum (ORFS) Measurement ..................................... 54
     - Making the Measurement .................................................................... 54
     - Results .................................................................................................. 55
   - GMSK Phase and Frequency Error Measurement ...................................... 58
     - Making the Measurement .................................................................... 58
     - Results .................................................................................................. 58
   - Troubleshooting Hints ............................................................................. 59
   - GMSK Power vs. Time Measurement .......................................................... 60
     - Making the Measurement .................................................................... 60
     - Results .................................................................................................. 60
   - Changing the View .................................................................................. 61
   - Changing the Display .............................................................................. 61
   - Troubleshooting Hints ............................................................................. 61
   - Power Steps Measurement ....................................................................... 62
     - Making the Measurement .................................................................... 62
     - Results .................................................................................................. 62
   - Transmitter Power Measurement ............................................................... 63
     - Making the Measurement .................................................................... 63
     - Results .................................................................................................. 63
   - Troubleshooting Hints ............................................................................. 64
   - Monitor Band/Channel Measurement .......................................................... 65
     - Making the Measurement .................................................................... 65
     - Results .................................................................................................. 65
   - Troubleshooting Hints ............................................................................. 66
   - Out-of-Band Spurious Measurement .......................................................... 67
     - Making the Measurement .................................................................... 67
     - Results .................................................................................................. 67
   - Inspecting Results ................................................................................... 68
   - Troubleshooting Hints ............................................................................. 68
   - Transmitter Receive Band Spurious Measurement ....................................... 69
     - Making the Measurement .................................................................... 69
# Contents

## Results
- Inspecting Results ................................................................. 71
- Troubleshooting Hints .............................................................. 71
- Transmitter Transmit Band Spurious Measurement ................................ 72
- Making the Measurement ......................................................... 72
- Inspecting Results ................................................................. 72
- Troubleshooting Hints .............................................................. 72
- Making Cable and Antenna Measurements .................................... 73
- Making Cable Fault Location Measurements .................................. 73
- Making Return Loss Measurements ............................................ 76
- Making Loss/Gain Measurements .............................................. 80

## 3. Key Reference
- Key Descriptions and Locations .................................................. 86
- Mode and Mode Setup Keys ....................................................... 87
- MODE ................................................................................. 87
- Mode Setup ........................................................................... 87
- AMPLITUDE Y Scale .................................................................. 92
- FREQUENCY Channel ................................................................. 94
- SPAN X Scale .......................................................................... 96
- Marker .................................................................................. 97
- Measurement Keys ..................................................................... 98
- MEASURE ............................................................................. 98
- Meas Setup ............................................................................... 98
- Display .................................................................................... 98
- View/Trace ............................................................................... 98
- Transmitter Power ................................................................. 99
- Power Steps ........................................................................... 101
- GMSK Power versus Time ....................................................... 102
- GMSK Phase and Frequency Error ........................................... 106
- GMSK Output RF Spectrum ..................................................... 109
- Cable Fault Location ................................................................. 113
- Transmit Band Spurious .......................................................... 115
- Receive Band Spurious ............................................................. 117
- Out of Band Spurious ............................................................... 118
- Monitor Band/Channel ............................................................. 120
- EDGE Power Versus Time ....................................................... 122
- EDGE EVM ........................................................................... 126
- EDGE Output RF Spectrum ..................................................... 129

## 4. Programming Commands
- Functional Index to SCPI Subsection ......................................... 136
- CALCulate Subsystem ................................................................. 139
- Test Current Results Against all Limits ...................................... 139
- EDGE Error Vector Magnitude (EEVM) - Limits ......................... 140
- EDGE Output RF Spectrum (EORFS) - Limits .......................... 146
- CALCulate:MARKers Subsystem ............................................. 186
- Out Of Band Spurious Emissions (OOBS) Absolute Limits Commands .... 190

1 Introduction to GSM and EDGE

This chapter introduces you to basics of GSM and EDGE technology and the general functionality of the ESA with the GSM (w/EDGE) measurement personality installed. In addition, sources for additional information on digital communications are listed.
What does the GSM/EDGE Measurement Personality and Hardware Do?

When configured with GSM or GSM (w/EDGE) mode personality software, the ESA series spectrum analyzer can help determine if a GSM/EDGE transmitter or receiver is working correctly. Industry standards are created documenting the testing requirements. These standards are continually being updated by the communications industry. The instrument software performs to the standard/date shown under Mode Setup, Radio.

When you select the standard format for use, the instrument automatically makes measurements using the measurement methods and limits defined in the standards. Detailed measurement results are displayed allowing you to analyze GSM/EDGE system performance.

Measurement parameters may be altered for specialized analysis. This is done within narrow limits because the standards specify the test methods and settings.

For infrastructure testing, the instrument tests base station transmitters and receivers in a non-interfering manner by using a coupler or power splitter.

The instrument makes the following one-button measurements (measurements activated by a single key press):

- Cable Fault Location
- Monitor Band/Channel
- Out of Band Spurious
- GMSK Output RF Spectrum
- GMSK Phase and Frequency Error
- Power Steps
- GMSK Power vs Time
- Receive (Rx) Band Spurious
- Transmit (Tx) Band Spurious
- Transmitter Power
- EDGE Power vs Time
- EDGE EVM
- EDGE Output RF Spectrum

In addition, the following manual measurements (measurements which are not activated by a single key press) can be performed:
• Loss/Gain (available in Spectrum Analysis mode)
• Return Loss (VSWR) (available in Spectrum Analysis mode)
Other Sources Of Measurement Information.

Application Notes

The following application notes describe digital communications measurements in much greater detail than discussed in this User Guide:

- Application Note 1298
  Digital Modulation in Communications Systems - An Introduction
  Agilent Technologies part number 5965-7160E

- Application Note 1311
  Understanding GSM Transmitter Measurements for Base Transceiver stations and Mobile Stations
  part number 5966-2833E

- Application Note 1313
  Testing and Troubleshooting Digital RF Communications Transmitter Designs
  part number 5968-3578E

- Application Note 1314
  Testing and Troubleshooting Digital RF Communications Receiver Designs
  part number 5968-3579E

- Application Note 150
  Spectrum Analyzer Basics
  part number 5952-0292

Additional Information

- Additional measurement application information is available from your local Agilent Technologies sales and service office.

- The latest information on ESA spectrum analyzers is available from the following URL:
  http://www.agilent.com/find/esa/

Updating the Firmware

Updated versions of the ESA-E Series Spectrum Analyzer firmware will be available via several sources. Information on the latest firmware revision can be accessed from the following URL:

http://www.agilent.com/find/esa/
Installing Optional Measurement Personalities

Activate License Key

The measurement personality software you have purchased with your instrument has been installed and the license key has been enabled at the factory. With any future purchase of a new personality software, you will receive an entitlement which can be redeemed to obtain the license key. The license key enables you to install, or reinstall, any measurement personality you have purchased. If you return the instrument to the factory for the installation of measurement personality software, you will receive no documentation of the license key, nor will you receive documentation of the license key for the measurement personality software you have purchased with your instrument.

Installing the License Key

If you are installing a new option, follow these steps to install the unique license key for the measurement personality software that you want to install in your instrument:

   
   When you press Option the alpha editor will be activated. For instructions on using the alpha editor, refer to the Agilent ESA Spectrum Analyzers User’s/Programmer’s Reference.

2. Use the alpha editor to enter the three letter designation for the software option that you wish to install in the instrument.

3. Press Done on the alpha editor menu.

4. Press License Key.
   
   When you press License Key the alpha editor will be activated. For instructions on using the alpha editor, refer to the Agilent ESA Spectrum Analyzers User’s/Programmer’s Reference.

5. Use the alpha editor to enter the 12 character license key for the software option that you wish to install in the instrument.

6. Press Done on the alpha editor menu.

7. Press Activate or Activate License to turn on the license key. You may now install the measurement personality option software.
Using Install Key

You may want to install a software revision, install new measurement software or reinstall measurement software that you have previously uninstalled, or uninstall measurement software. Before you can install software, you will need a set of installation diskettes.

If you have ordered a measurement personality, you will receive the installation disk set in the option upgrade package. If you are updating an existing, previously installed measurement option, you may order the diskettes from Agilent Technologies or create a set from the Agilent internet site shown in “Updating the Firmware” on page 1-40. When you order the updated software disk set, you will need to order Option UE2. (Option UE2 is a firmware update and is needed to ensure that the firmware and the software are compatible.) A set of diskettes can be ordered from your local Agilent Technologies service or sales office. To create a disk set refer to “Creating Software Installation Disks” below.

Creating Software Installation Disks

To create the installation disks on-line, visit the Agilent internet site shown in “Updating the Firmware” on page 1-40. Follow the instructions provided on the internet site for downloading the current measurement personality software and creating the installation disk set. The instructions for creating the disk set will step you through the process to create a firmware disk set when you create the measurement personality software disk set. (A firmware update may be needed to ensure that the firmware and the software are compatible.) After you have created the disk set, follow the on-line instructions to install the firmware. After successfully installing the firmware update, proceed with the following instructions for installing the measurement personality software in your instrument.

Installing Personality/Software Options

This procedure gives steps to install a new software option in an ESA-E Series Spectrum Analyzer using the internal floppy drive of the instrument. Screen messages display the update progress and give directions. The instrument will not need to be re-calibrated after this procedure since no changes are made to calibration or adjustment files.

If you have a problem with the installation process, refer to “Troubleshooting the Installer” on page 1-44.

NOTE

When the installer starts up, it examines the instrument to ensure that all the required software and hardware options are present. If they are not, the installer will generate an error and you will not be able to install the personality.
NOTE
Because the current version of the GSM (w/EDGE) personality is so large (approximately 5 MB), it will not be possible to upgrade from an earlier version of GSM without uninstalling the earlier version first. After uninstalling the earlier version, cycle power on the analyzer before beginning the installation of the new version; this will ensure the maximum amount of memory is available for the installation. If the earlier version is not uninstalled, there will not be enough free memory to install the new version.

NOTE
If you will be installing several personalities, Agilent recommends that you install the largest personality first and the smallest personality last.

1. If this is the installation of new personality option software, you must enter the License Key for the new option. For instructions on entering the License Key, refer to the “Installing the License Key” on page 1-41.
   
   When you have completed entering the license key, continue with the next step.

2. Insert disk one of the installation disk set into the disk drive located on the right side of the ESA front panel.

3. Press System, More, Personalities, and Install. The instrument will then load the installer from the floppy drive. If there is no floppy in the drive, the incorrect disk is inserted, or there is no installer on the disk, the error “No install disk present in disk drive” will be shown.

   Once the instrument has loaded the installer, the screen will change to the installer screen and the Install Pers. menu will be shown. For more information on the installer screen and menu, refer to “Installer Screen and Menu” on page 1-45.

4. When the installer first starts up, it will show a popup message. Select Verify Disks.

NOTE
Once the installer has begun installing a personality, any error will cause the whole personality (including a previously installed version) to be removed from the instrument. Because of this, it is very important that you verify the disks prior to installing them. If any of the disks or files are bad, you will not be able to use the personality until you obtain a new installation disk set and run the install using them.

5. When prompted, insert the next disk and press Verify Disks again.
   
   When Verify Disks is running, the Install Now and Exit Install keys will be grayed out.

6. When the verification is complete, press Install Now and the installation of the personality will begin. Some of the disks may take
only a short time to load or be skipped entirely, while others can take up to about 30 minutes to load.

When Installer is running, the Verify Disks and Exit Install keys will be grayed out.

7. When prompted, insert the next disk and press Install Now again.

8. Once the installation is complete, press Exit Install.

Troubleshooting the Installer

If the installation process stalls or fails in another way, follow these steps to resolve your problem.

1. If the error message “Failed to load DLP c:dlp\gsm\gsm.o” appears after the installation has been completed:
   a. Press Exit Install to exit the installer.
   b. Press Mode. If GSM (w/EDGE) does not appear on one of the softkeys, cycle power on the analyzer.
      - If the error message “Failed to load DLP a:install.o” appears, ignore this message; the message indicates that the installer was not exited properly. Press the Mode key. If GSM (w/EDGE) now appears on one of the softkeys, the installation was successful.
      - If GSM (w/EDGE) does not appear on one of the softkeys, get in touch with your nearest Agilent sales and service office as described below in step 3.

2. If the instrument stops the update process before all the disks are loaded proceed as follows:
   a. Press Exit Install to abort the process.
   b. Return to step 2 under “Installing Personality/Software Options” and start the installation process again.

3. If the instrument fails after repeating the installation procedure, get in touch with your nearest Agilent sales and service office for assistance. Please provide the following information:

   Model Number:
   Serial Number:
   State that you are having trouble installing a software option update.
Installer Screen and Menu

The top portion of the install screen is a table in which the files that are about to be installed are listed. The bottom portion of the screen contains information needed to track the progress of the install.

1. **File Table** displays the files to be installed and various file information. If there are more than six files, **Next Item** and **Prev Item** allow you to scroll the table to view additional items.

2. **File Name** displays the name of the files on the installation disk.

3. **Current Version** displays the version of the file that is currently installed in the instrument. (This field will be blank if this file is not currently installed in the instrument or if the file is a data file that has no version.)

4. **Upgrade Version** shows the version of the file on the install disk. This is the version of the file that will replace the currently installed version.

5. **Status** is updated to reflect what the installer is doing to the current file as the install progress. The valid messages seen in this column are listed in Table 1-1 on page 46.

6. **Data Field** contains a status bar and various status information.

7. **Processing disk** shows the disk that is currently being read.

8. **Processing item** shows the file that is being processed by item number.

9. **Bytes free on C** is the number of bytes currently free on the instrument C: drive.
10 **Status Bar** contains a status bar that runs from 0 to 100% and tracks the progress of the current step and a message line displays the step that is currently being executed.

11 **Bytes in package** lists the number of bytes in the install package.

12 **Bytes left in package** lists the number of bytes left to be read.

13 Message and error popup window that displays over the status bar. Information in this box will prompt you for action required to proceed to the next phase of the installation. It may also inform you of errors in the installation process and may prompt you for action required to correct the problem.

### Table 1-1 Installer Status Messages

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Failed</td>
<td>This means that something has gone wrong while processing this item. It is a fatal error and the installation can not be completed. The installer will try to get the system back to a good state which may entail completely removing the currently installed personality.</td>
</tr>
<tr>
<td>Loading</td>
<td>The file is currently being copied from the install media to the instrument’s file system.</td>
</tr>
<tr>
<td>Verifying</td>
<td>This may mean one of two things:</td>
</tr>
<tr>
<td></td>
<td>1. If “Verify Disks” was pressed then Verifying means that the installer is currently reading the install media and comparing the known checksums to ensure the data is good.</td>
</tr>
<tr>
<td></td>
<td>2. If “Install Now” was pressed, then Verifying means that the installer is reading what was just loaded to ensure the checksum is correct.</td>
</tr>
<tr>
<td>Loaded</td>
<td>This means that the data has been placed on the instrument disk but has not yet been registered with the firmware.</td>
</tr>
<tr>
<td>Installed</td>
<td>This means that the data has been loaded into the instrument and registered. The install for this file is complete.</td>
</tr>
<tr>
<td>Skipping</td>
<td>This means that the installer has determined that this file does not need to be loaded into the instrument.</td>
</tr>
</tbody>
</table>
Options Required

Installing the GSM or GSM with EDGE measurement personality firmware and making the associated measurements require certain basic equipment. This section lists the compatible ESA Spectrum Analyzers and required hardware options.

These measurement personalities are not compatible with all ESA spectrum analyzer models. Table 1-2 lists the models that are compatible and the upper frequency range of each.

Table 1-2  

**Compatible Agilent ESA Spectrum Analyzers**

<table>
<thead>
<tr>
<th>Model Number</th>
<th>Upper Frequency Range</th>

<tr>
<td>E4404B</td>
<td>6.7 GHz</td>
</tr>
<tr>
<td>E4405B</td>
<td>13.2 GHz</td>
</tr>
<tr>
<td>E4407B</td>
<td>26.5 GHz</td>
</tr>
</tbody>
</table>

Additional hardware options must be installed in the spectrum analyzer before the measurements can be made. Table 1-3 lists the hardware options available and the measurements that they enable. For optimum performance, Option B74 should be installed in your spectrum analyzer.

Not all of the options can be installed by the user. Some of the options require that the instrument be returned to the factory or an Agilent Technologies service center. In addition, some of the options require Performance Verification and Adjustments to be performed after installation. Refer to Table 1-3 on page 48 for option specific information.
Table 1-3  GSM/EDGE Hardware Options and measurements

<table>

</tr>
</tbody>
</table>

<sup>a</sup> Factory installation only.
<sup>b</sup> Service center or factory installation, calibration required.

**NOTE**
If the appropriate hardware is not present, the measurement softkey under the Measure menu will be grayed out and that measurement will not be available.
2 Making Measurements

This chapter introduces the basic measurement procedure including mode setup and changing measurement frequency.
Measurement topics described include:

- “Preparing To Make Measurements” on page 2-51
- Base Station Measurements:
  - “GMSK Output RF Spectrum (ORFS) Measurement” on page 2-54
  - “GMSK Phase and Frequency Error Measurement” on page 2-58
  - “GMSK Power vs. Time Measurement” on page 2-60
  - “Power Steps Measurement” on page 2-62
  - “Transmitter Power Measurement” on page 2-63
- Air Interface Measurements:
  - “Monitor Band/Channel Measurement” on page 2-65
  - “Out-of-Band Spurious Measurement” on page 2-67
  - “Transmitter Receive Band Spurious Measurement” on page 2-69
  - “Transmitter Transmit Band Spurious Measurement” on page 2-72
  - “Transmitter Power Measurement” on page 2-63
- Cable and Antenna Measurements:
  - “Making Cable Fault Location Measurements” on page 2-73
  - “Making Return Loss Measurements” on page 2-76
  - “Making Loss/Gain Measurements” on page 2-80
Preparing To Make Measurements

At initial power up, the analyzer is in Spectrum Analysis mode. To access the GSM or EDGE measurement personality, press the MODE front panel key and select the GSM or GSM (w/EDGE) menu key.

Initial settings

Before making a measurement, make sure the mode setup, measurement setup, and frequency channel parameters are set to the appropriate settings. For further information refer to “Mode Setup Menu” on page 6-456, “Frequency/Channel Menu” on page 6-439, and “Measurement Setup Menus” on page 6-442.

- Resetting parameters with Preset:

  To set all instrument parameters (including mode setup and measurement setup parameters) to factory default values, set the instrument Preset Type to Factory, then press the Preset front panel key. Note that the mode is changed to Spectrum Analysis. After pressing Preset with the preset type set to Factory, you must use the MODE key to return to GSM or GSM(w/EDGE) mode.

  To set all mode parameters to factory default values, set the instrument Preset Type to Mode, then press the Preset front panel key.

  The Preset front panel key can also be used to return the instrument to a set of user preset values. Refer to the ESA Spectrum Analyzers User’s Guide for further information.

- Resetting mode setup parameters:

  Mode setup parameters apply to all measurements in this mode. To reset them to factory default values, press Mode Setup then Restore Mode Setup Defaults.

- Resetting measurement setup parameters:

  Measurement setup parameters affect the current measurement only. To reset them to factory default values (for the current measurement only), press Meas Setup then Restore Meas Defaults.

Making A Measurement

These measurements are intended to be used as “one button” measurements. This means that the appropriate measurement can be selected and run by a single key press once the instrument has been connected to the equipment to be tested. The measurement is made automatically using default parameters defined by the selected standard and the tuning plan.
Even though the measurements are designed as one-button measurements, you may change the default settings using various setup keys. However, changing the default settings may produce measurement results that are outside of the parameters of the selected standard and tuning plan requirements.

Most measurements can be performed using the simple four-step procedure outlined in the table below. Most measurements are performed using only the primary keys listed in conjunction with a minimum of setup keys. Measurement setup keys (Meas Setup) can be used for non-standards compliant testing. For more information see “Initial settings” above.

<table>

**Figure 2-1** Primary Keys Used for Performing Measurements
Saving Measurement Results

To save measurement results, follow the process shown below. For additional information on file management in the spectrum analyzer, refer to the *ESA Spectrum Analyzers User’s/Programmer’s Reference*.

1. Press **File, Save, Type, More, and Measurement Results**.

2. If you want to change the file name, press **Name**, and use the Alpha Editor to enter the new name. For more information on using the Alpha Editor, refer to the *ESA Spectrum Analyzers User’s Guide*.

3. Press **Save Now** to complete the file saving process.

4. If you have used the default file name and wish to save additional measurement results, press **Save**. The current measurement result will be saved with the next default file name.

5. If you have not used the default file name and wish to save additional measurement results, repeat steps 1 through 3.
GMSK Output RF Spectrum (ORFS) Measurement

Making the Measurement

1. Press the **Measure** key.
2. Press the **Output RF Spectrum** key.

Factory default parameter settings provide a GSM compliant measurement. For special requirements, you may need to change default settings:

- Mode setup and frequency/channel parameters. Use the **Mode Setup** and **Frequency Channel** keys to change these parameters for all measurements made within the current mode. For further information refer to Chapter 1 of this document.

- Measurement setup parameters. These are measurement specific parameters changed using the Measurement setup (**Meas Setup**) menu. Parameters can be returned to default settings at any time by pressing **Meas Setup, More (1 of 2)** and **Restore Meas Defaults**. For further information on measurement setup parameters, refer to Chapter 3, “Key Reference,” on page 85.

The following keys provide useful measurement functionality:

- Changing between multiple, single and swept modes:
  
  Press **Meas Setup** followed by **Meas Method**.

- Changing between modulation and switching:

  Press **Meas Setup** followed by **Meas Type**

- To change the table display:

  The table display can be changed to display results, the specification limits, or the margins. Press the **Display** front panel key followed by the **Table Display** menu key to toggle between these settings.

---

**NOTE**

Parameters that exist under the **Meas Setup Advanced** key seldom need to be changed. Any changes from the default values may result in invalid measurement data.
Results

Figure 2-2  
**Output RF Spectrum (ORFS) Due To Modulation: Single Offset Measurement**

*Figure 2-2* shows a single offset trace taken during an ORFS due to modulation measurement. The vertical bars show the portion used to measure power due to modulation. If averaging is turned on, the trace is averaged with previous traces using video averaging. The displayed value is the average of points within the vertical bars.

Figure 2-3  
**Output RF Spectrum (ORFS) Due To Modulation: Multiple Offset Measurement**

*Figure 2-3* shows offset measurements taken during an ORFS due to modulation (multiple offset) measurement.
Figure 2-4  Output RF Spectrum (ORFS) Due To Modulation: Swept Measurement

Figure 2-4 shows a swept trace taken during an ORFS due to modulation measurement. If averaging is turned on, the display is averaged over successive sweeps until the required number of sweeps has been reached. It then starts again with a fresh display.

Figure 2-5  Output RF Spectrum (ORFS) Due To Switching Transients: Single Offset Measurement

Figure 2-5 shows a single offset trace taken during an ORFS due to switching transients measurement. If averaging is turned on, the trace is averaged with previous traces. The peak of the traces is used. The displayed value is the maximum of all points for all traces (Max or Peak) over the entire frame.
Figure 2-6  Output RF Spectrum (ORFS) Due To Switching Transients: Multiple Offset Measurement

Figure 2-6 shows a table of multiple offset measurements taken during an ORFS due to switching transients measurement.

Figure 2-7  Output RF Spectrum (ORFS) Due To Switching Transients: Swept Measurement

Figure 2-7 (above) shows a trace of a swept measurement taken during an ORFS due to switching transients measurement. If averaging is turned on, the display is averaged over successive sweeps until the required number of sweeps has been reached. It then starts again with a fresh display.
GMSK Phase and Frequency Error Measurement

Making the Measurement

1. Press the **Measure** key.
2. Press the **Phase and Frequency** key.

Factory default parameter settings provide a GSM compliant measurement. For special requirements, you may need to change default settings:

- **Mode setup and frequency/channel parameters.** Use the **Mode Setup** and **Frequency Channel** keys to change these parameters for all measurements made within the current mode. For further information refer to Chapter 1 of this document.

- **Measurement setup parameters.** These are measurement specific parameters changed using the Measurement setup (**Meas Setup**) menu. Parameters can be returned to default settings at any time by pressing **Meas Setup**, **More (1 of 2)** and **Restore Meas Defaults**. For further information on measurement setup parameters, refer to Chapter 3, “Key Reference,” on page 85.

Results

Figure 2-8 Phase and Frequency Error Result - I/Q Quad view
**Figure 2-9**  Phase and Frequency Error Result - I/Q Measured view

**Troubleshooting Hints**

Poor phase error indicates a problem with the I/Q baseband generator, filters, or modulator in the transmitter circuitry. The output amplifier in the transmitter can also create distortion that causes unacceptably high phase error. In a system, poor phase error will reduce the ability of a receiver to correctly demodulate, especially in marginal signal conditions. This ultimately affects range.

Occasionally, a Phase and Frequency Error measurement may fail the prescribed limits at only one point in the burst, for example at the beginning. This could indicate a problem with the transmitter power ramp or some undesirable interaction between the modulator and power amplifier.
GMSK Power vs. Time Measurement

Making the Measurement

1. Press the Measure key.
2. Press the Power vs Time key.

Factory default parameter settings provide a GSM compliant measurement. For special requirements, you may need to change default settings:

- Mode setup and frequency/channel parameters. Use the Mode Setup and Frequency Channel keys to change these parameters for all measurements made within the current mode. For further information refer to Chapter 1 of this document.

- Measurement setup parameters. These are measurement specific parameters changed using the Measurement setup (Meas Setup) menu. Parameters can be returned to default settings at any time by pressing Meas Setup, More (1 of 2) and Restore Meas Defaults. For further information on measurement setup parameters, refer to Chapter 3, “Key Reference,” on page 85.

NOTE: Parameters that exist under the Meas Setup Advanced key seldom need to be changed. Any changes from the default values may result in invalid measurement data.

Results

Figure 2-10 Power versus Time Measurement Result - Mask View
Power vs Time Custom Masks

For the Power vs Time measurement, you can define a user configurable limit mask to apply to the measured burst. This feature can only be accessed via SCPI commands. For further information refer to Chapter 4, “Programming Commands,” on page 135.

Figure 2-11 Power versus Time Measurement Result - Monitor View

Changing the View

The View/Trace key will access a menu which allows you to select the desired view of the measurement from the following selections:

- **Mask** - views the entire sweep as specified by the meas time and compares the burst against a predefined mask. An example of this is shown in Figure 2-10 (above).

- **Monitor** - views the entire sweep as specified by the meas time and displays frame structure annotation. An example of this is shown in Figure 2-11 (above). A Max Hold function is provided to allow monitoring over time.

Changing the Display

The Display key allows you to turn the limit mask on and off. This also disables the mask limit test, but still calculates the power in the useful part.

Troubleshooting Hints

If a transmitter fails the Power vs Time measurement this usually indicates a problem with the unit’s output amplifier or leveling loop.
Power Steps Measurement

Making the Measurement

1. Press the Measure key.

2. Ensure the carrier level to be measured is set to the maximum power step level. The power steps measurement performs the auto level routine upon entering the measurement, positioning the signal level at the top of the screen.

3. Press the Power Steps key.

Factory default parameter settings provide a GSM/EDGE compliant measurement. For special requirements, you may need to change default settings:

- Mode setup and frequency/channel parameters.
  Use the Mode Setup and Frequency Channel keys to change these parameters for all measurements made within the current mode. For further information refer to Chapter 3, “Key Reference,” on page 85.

- Measurement setup parameters.
  These are measurement specific parameters changed using the Measurement setup (Meas Setup) menu. Parameters can be returned to default settings at any time by pressing Meas Setup and Restore Meas Defaults. For further information on measurement setup parameters, refer to Chapter 3, “Key Reference,” on page 85.

Results

Figure 2-12 Power Steps Measurement
Transmitter Power Measurement

Making the Measurement

1. Press the Measure key.

2. Press the Transmitter Power key.

Factory default parameter settings provide a compliant measurement. For special requirements, you may need to change default settings:

• Mode setup and frequency/channel parameters.
  Use the Mode Setup and Frequency Channel keys to change these parameters for all measurements made within the current mode. For further information refer to Chapter 1 of this document.

• Measurement setup parameters.
  These are measurement specific parameters changed using the Measurement setup (Meas Setup) menu. Parameters can be returned to default settings at any time by pressing Meas Setup, More (1 of 2) and Restore Meas Defaults. For further information on measurement setup parameters, refer to Chapter 3, “Key Reference,” on page 85.

**NOTE**
Parameters that exist under the Meas Setup Advanced key seldom need to be changed. Any changes from the default values may result in invalid measurement data.

Results

Figure 2-13 Transmitter Power Result - Single Burst
Figure 2-14  Transmitter Power Result - Multiple Bursts

Troubleshooting Hints

Low output power can lead to poor coverage and intermittent service for phone users. Out of specification power measurements indicate a fault usually in the power amplifier circuitry. They can also provide early indication of a fault with the power supply, that is the battery in the case of mobile stations.
Monitor Band/Channel Measurement

Making the Measurement

1. Press Measure, More (1 of 3).
2. Press the Monitor Band/Channel key.
4. Press Method to set the measurement to Band or Channel.

Factory default parameter settings provide a compliant measurement. For special requirements, you may need to change default settings:

- Mode setup and frequency/channel parameters. Use the Mode Setup and Frequency Channel keys to change these parameters for all measurements made within the current mode. For further information refer to Chapter 1 of this document.

- Measurement setup parameters. These are measurement specific parameters changed using the Measurement setup (Meas Setup) menu. Parameters can be returned to default settings at any time by pressing Meas Setup, More (1 of 2) and Restore Meas Defaults. For further information on measurement setup parameters, refer to Chapter 3, “Key Reference,” on page 85.

**NOTE**
Parameters that exist under the Meas Setup Advanced key seldom need to be changed. Any changes from the default values may result in invalid measurement data.

Results

Example screens from making a band measurement are shown in Figure 2-15 on page 66 and a channel measurement in Figure 2-16 on page 66.
### Troubleshooting Hints

- If an external attenuator is used, be sure to include the attenuation value in the measurement. This can be done under the Input front panel key for any setup except for when the Method is set to Band, and Band monitoring is set to Rx.

- If an external preamplifier is used, be sure to include the gain value in the measurement. This can be done under the Input front panel key only when the Method is set to Band, and Band monitoring is set to Rx.
Out-of-Band Spurious Measurement

Making the Measurement

1. Press Measure, More (1 of 3).
2. Press the Out Of Band Spurious key.

Factory default parameter settings provide a GSM/EDGE compliant measurement. For special requirements, you may need to change default settings:

- **Mode setup and frequency/channel parameters.**
  Use the Mode Setup and Frequency Channel keys to change these parameters for all measurements made within the current mode. For further information refer to Chapter 1 of this document.

- **Measurement setup parameters.**
  These are measurement specific parameters changed using the Measurement setup (Meas Setup) menu. Parameters can be returned to default settings at any time by pressing Meas Setup, More (1 of 2) and Restore Meas Defaults. For further information on measurement setup parameters, refer to Chapter 3, “Key Reference,” on page 85.

**NOTE** Parameters that exist under the Meas Setup Advanced key seldom need to be changed. Any changes from the default values may result in invalid measurement data.

Results

**Figure 2-17 Out-of-Band Spurious Measurement Results**
NOTE

Results are shown in tabular format beneath the trace. To view this section of the window in its entirety, press the Next Window menu key until it is highlighted, then press the Zoom menu key.

Inspecting Results

1. Select a specific spur:
   - Press Meas Setup, Inspect Spur and Inspect Spur ON. If any spurs have been measured, the current spur number is highlighted in the results table.
   - Move up and down the list of spurs using the numeric keypad or tab keys.

2. Inspect a specific spur by using:
   - Parameters contained under the Frequency, Span and Amplitude front panel keys.
   - Sweep Time, Res BW and Video BW parameters, contained under Meas Setup, and Inspect Spur.

Troubleshooting Hints

- If an external attenuator is used, be sure to include the attenuation value in the measurement. This can be done under the Input, Ext Atten menu.
- If an external preamplifier is used, be sure to include the gain value in the measurement. This can be done under the Input and Ext Gain menu.
Transmitter Receive Band Spurious Measurement

Making the Measurement

1. Press **Measure, More (1 of 3)**.
2. Press the **Rx Band Spur** key.

The following cautionary information form is displayed:

**Figure 2-18 Rx Band Spurious Cautionary Information Form**

![Diagram of Rx Band Spurious Setup]

**Preamp Gain 20.00 dB**

**CAUTION**: TO AVOID ANALYZER DAMAGE!
- Connect a receive band (830.20 to 914.80 MHz) bandpass filter (BPF) between the transmitter output and the analyzer input.
- The total carrier power applied to the analyzer MUST be < +20 dBm.
- The input power should be kept < –10 dBm for correct results.

<table>
<thead>
<tr>
<th>Preamp Gain</th>
<th>20.00 dB</th>
</tr>
</thead>
</table>

A preamplifier following the BPF is required for optimum sensitivity. Set the value of the preamp gain parameter to be the combined value of BPF loss, external preamp gain, and cable loss.

Pressing 'Continue' will set the attenuator to 0 dB.

**CAUTION**
The spectrum analyzer is vulnerable to damage at the input if the above cautionary information is not observed before continuing with the measurement.

a. Connect a receive band bandpass filter (BPF) between the transmitter output and the analyzer input. This is required as the total carrier power applied to the analyzer must be < +20 dBm and to achieve correct results the input power must be kept at < –10 dBm.

b. Connect a preamplifier following the BPF. This can be either external or internal. If an internal preamp is not fitted the Int Preamp option is grayed out. This is required to achieve optimum sensitivity.

c. Enter a preamp gain value.
Making Measurements

Transmitter Receive Band Spurious Measurement

d. Press **Continue**.

Factory default parameter settings provide a GSM/EDGE compliant measurement. For special requirements, you may need to change default settings:

- **Mode setup and frequency/channel parameters.**
  Use the **Mode Setup** and **Frequency Channel** keys to change these parameters for all measurements made within the current mode. For further information refer to Chapter 1 of this document.

- **Measurement setup parameters.**
  These are measurement specific parameters changed using the measurement setup (**Meas Setup**) menu. Parameters can be returned to default settings at any time by pressing **Meas Setup**, and **Restore Meas Defaults**. For further information on measurement setup parameters, refer to Chapter 3, “Key Reference,” on page 85.

**NOTE**

Parameters that exist under the **Meas Setup Advanced** key seldom need to be changed. Any changes from the default values may result in invalid measurement data.

**Results**

An example screen from a Transmitter Rx-Band Spurious measurement is shown below:

**Figure 2-19 Transmitter Rx Band Spurious Measurement Results**
Inspecting Results

Results are displayed according to the categories listed in the following table:

<table>
<thead>
<tr>
<th>Result category</th>

Troubleshooting Hints

- If an external attenuator is used, be sure to include the attenuation value in the measurement. This can be done under the **Input, Ext Atten** menu.
Making Cable and Antenna Measurements

This section details how to make cable and antenna measurements. The following measurements are described:

- Cable fault location (performed in GSM or GSM with EDGE mode).
- Return loss (VSWR) (performed in Spectrum Analysis mode).
- Loss/gain (Transmit band LNA gain and flatness/receive band combiner loss and flatness) (performed in Spectrum Analysis mode).

NOTE: The return loss (VSWR) and loss/gain measurements are not “one button” measurements. All steps required to run them are fully detailed in this chapter.

Making Cable Fault Location Measurements

Example

NOTE: Cable fault measurements require the use of a power divider.

1. Enter GSM or GSM with EDGE mode and access the measurement.
   a. Press the Mode front panel key.
   b. Press the GSM (or GSM (w/EDGE)) menu key.
   c. Press the Cable Fault Location menu key.
   d. Connect up the equipment as prompted by the dialog box and illustrated in Figure 2-20 on page 74.
2. Configure the spectrum analyzer for the appropriate cable type.
   a. Press the **Cable Type** menu key.
   b. Page through available cable types using the **tab**, **RPG**, or **Step** keys.
   c. Press the **Select** menu key to select the appropriate cable type.

3. Set up a maximum range value just greater than the length of the cable to be tested:
   a. Press the **Max Range** menu key.
   b. Enter the appropriate value using the numeric key pad.

4. Calibrate the spectrum analyzer.
   Calibration removes any errors introduced by the cabling and components of the test setup before making the measurement.

   **NOTE** Press the **Esc** front panel key to cancel this procedure at any stage.
   a. Disconnect the cable to be tested.
   b. Press the **Meas Setup** front panel key.
   c. Press the **Calibrate** menu key.
      Connect a 50 ohm termination to the analyzer via the power divider as prompted (see **Figure 2-21**).
   d. Press the **Calibrate** menu key.
e. Re-connect the cable to be tested in place of the load, as prompted by the dialog box.

f. Press the Esc front panel key to remove the dialog box and end the calibration procedure.

Figure 2-21 Calibrating the spectrum analyzer for cable fault location

Figure 2-22 Example Cable Fault Location Measurement Screen

5. The result is shown on the screen. Read the measurement and save it if required. Press the Marker front panel key to move the marker to the fault(s) of interest. An example is shown in Figure 2-22.
Making Return Loss Measurements

NOTE

The return loss (VSWR) measurement is not a “one button” measurement. All steps required to run it is fully detailed in this chapter.

A return loss measurement requires the use of a signal separation device such as a directional coupler or bridge in addition to the device being tested for return loss.

NOTE

The spectrum analyzer must be in spectrum analyzer mode for this measurement.

1. Connect the tracking generator, signal separation device, device being measured and the spectrum analyzer input as shown in Figure 2-23.

Figure 2-23  Return Loss Measurement Set-up

2. Turn on the tracking generator.
   a. Press the **Source** front panel key.
   b. Press the **Amplitude** menu key so that the tracking generator is turned on.
   c. Set an amplitude level appropriate for the device under test. The default value = –10 dBm. 0 dBm may be used for systems with higher loss.
3. Adjust the spectrum analyzer control settings (for example frequency, resolution bandwidth, sweep time and input attenuation) as appropriate for the signal separation device and device being tested.

4. Establish a 0 dB reference trace for normalizing the measured data.
   a. Remove the device to be measured and replace it with a short or open as shown in Figure 2-24.
   b. Press the View/Trace front panel key.
   c. Press the More menu key.
   d. Press the Normalize menu key, Store Ref (1 - 3) and normalize On.

**Figure 2-24  Calibrating the Spectrum Analyzer for Return Loss**

5. Make the measurement.
   a. Re-connect the device to be measured to the signal separation device.
   b. Read the measurement and save it if required.

**Example**

The following example measures the return loss of a bandpass filter (BPF).

1. Adjust the spectrum analyzer control settings.

   With the BPF in the measurement path, adjust the spectrum analyzer control settings for the correct frequency coverage,
resolution bandwidth, input attenuation and source power.

NOTE

Having adjusted the control settings, do not alter them during the course of the measurement.

To obtain a faster sweep, change the coupling from normal spectrum analyzer mode to stimulus response mode by pressing the Sweep front panel key and Swp Coupling SR SA menu key until SR is underlined.

2. Establish a 0 dB reference trace for normalizing the measured data.

Normalization removes any frequency-response errors introduced by the components of the test setup before making the measurement. It is performed by removing the device to be tested and measuring a short or open. As neither can dissipate the energy of the incident signal—100% reflection takes place, the wave is reflected back from the short or open—that is, 100% reflection takes place—to the spectrum analyzer where its value is displayed:

a. Remove the BPF and connect a short in its place as shown in Figure 2-24.

b. Press the View/Trace front panel key.

c. Press the More menu key.

d. Press the Normalize menu key, Store Ref (1 - 3) and normalize On.

This procedure establishes a 0 dB reference trace which is stored in the ESA/spectrum analyzer. It is then used to normalize the measured data automatically by subtracting the short circuit calibration from the measurement obtained with the device.

3. Make the measurement.

a. Re-connect the device in place of the short/open.

b. Read the measurement and save it if required.

The return loss of the device is displayed on the screen. Use the marker to evaluate the result and save the trace if required.

An example is shown in Figure 2-25 on page 79.
Converting Return Loss to VSWR

Return loss can be expressed as a voltage standing wave ratio (VSWR) value using the following formula:

\[
VSWR = \frac{1 + \frac{-RL}{20}}{1 - \frac{-RL}{20}}
\]

Where: RL is the measured return loss value.

You can also use Table 2-1 on page 80 to find the VSWR at each listed return loss value.

VSWR is sometimes stated as a ratio. For example: 1.2:1 (“one point two to one”) VSWR. The first number is the VSWR value taken from the table or calculated using the formula. The second number is always 1.
Table 2-1  Power to VSWR Conversion

Making Loss/Gain Measurements

NOTE
The loss/gain measurement is not a “one button” measurement. All steps required to run it is fully detailed in this chapter.

NOTE
The spectrum analyzer must be in spectrum analyzer mode for this measurement.

1. Connect the tracking generator to the device input and the device...
output to the input of the spectrum analyzer as shown in Figure 2-26.

**Figure 2-26 Loss/Gain Measurement Set-up**

![Diagram of Loss/Gain Measurement Set-up](image)

* The two 6 dB Attenuators may be used to improve impedance matching. However, you will lose 12 dB of dynamic range.

2. Turn on the tracking generator.
   a. Press the **Source** front panel key.
   b. Press the **Amplitude** menu key so that the tracking generator is turned on.
   c. Set an amplitude level appropriate for the device under test.

3. Adjust the spectrum analyzer control settings (for example frequency, resolution bandwidth, sweep time and input attenuation) as appropriate for the device being tested.

4. Establish a 0 dB reference trace for normalizing the measured data.
   a. Remove the device from the measurement path and connect the equipment as shown in Figure 2-27.
   b. Press the **View/Trace** front panel key.
   c. Press the **More** menu key.
   d. Press the **Normalize** menu key, **Store Ref (1 - 3)** and normalize **On**.
Figure 2-27  Calibrating the Analyzer for Loss/Gain Measurement

* The two 6 dB Attenuators may be used to improve impedance matching. However, you will lose 12 dB of dynamic range.

5. Make the measurement.

a. Re-connect the device.

Re-connect the tracking generator RF output to the device input and the device output to the spectrum analyzer input as shown in Figure 2-26 on page 81.

b. Read the measurement and save it if required.

Example

The following example measures the gain/loss of a bandpass filter (BPF).

1. Adjust the spectrum analyzer control settings.

With the BPF in the measurement path, adjust the spectrum analyzer control settings for the specific type of measurement to be made. For example:

- If making a passband-ripple measurement, the spectrum analyzer requires a narrow span and typically < 10 dB per vertical division to get more resolution on the display.
- If making a stop-band attenuation measurement, the spectrum analyzer requires a wide span and a narrow RBW filter.

---

**NOTE**

Having adjusted the control settings, do not alter them during the course of the measurement.

To obtain a faster sweep, change the coupling from normal spectrum analyzer mode to stimulus response mode by pressing the **Sweep**
front panel key and **Swp Coupling SR SA** menu key until SR is underlined. Note that the limitation on sweep speed is typically determined by the device and care must be taken to allow the device sufficient time to respond to the signal being passed through it. If the auto stimulus-response-mode sweep is too fast, slow it down until no changes in amplitude occur on the trace.

2. Establish a 0 dB reference trace for normalizing the measured data.

   Normalization removes any frequency-response errors introduced by the components of the test setup before making the measurement. It is performed by removing the device and measuring a ‘thru’ from the source directly to the receiver. This establishes a 0 dB reference trace which is stored in the spectrum analyzer and then used to normalize the measured data:

   a. Remove the BPF and connect the tracking generator output directly to the spectrum analyzer input, as shown in Figure 2-27, using the same test cables to be used when making the measurement. Use a thru adaptor to connect the test cables if necessary.

   b. Press the **View/Trace** front panel key.

   c. Press the **More** menu key.

   d. Press the **Normalize** menu key, **Store Ref (1 - 3)** and normalize **On**.

   This procedure automatically subtracts the measured ‘thru’ level from an ideal ‘thru’ (a flat reference line) and stores it. This reference is then used to normalize the measured signal where:

   \[
   \text{normalized signal} = \text{measured signal} - \text{error}
   \]

   With the device disconnected, the displayed trace is then flat, or normalized.

   The normalized trace can be moved to a different position on the display by pressing the **Norm Ref Posn** menu key. This may be useful if the device to be tested has positive gain, such as an amplifier.

3. Make the measurement.

   a. Re-connect the tracking generator to the BPF input and the BPF output to the spectrum analyzer.

   b. Read the measurement and save it if required.

   Use the marker to evaluate the result and save the trace if required.

   An example is shown in Figure 2-28 on page 84.
Figure 2-28  Example Loss/Gain Measurement for a Bandpass Filter
3 Key Reference

This chapter provides detailed descriptions of the keys used to set up, make, and view GSM (w/EDGE) measurements. The keys are described in the order they appear under each of the front panel menu keys.
Key Descriptions and Locations

This chapter provides information on GSM (w/EDGE) front panel keys which do not exist in Spectrum Analysis mode or keys which have different functionality from SA mode equivalents. For information on SA mode keys not described in this chapter, refer to the *ESA Spectrum Analyzers User’s/Programer’s Reference*.

Mode and Mode Setup Keys

MODE

The **MODE** front panel key provides access to menu keys for selecting the analyzer measurement mode.

The basic spectrum analyzer comes with only Spectrum Analysis mode installed—measurement personality firmware must be installed for other **MODE** menu keys to be labelled and functional.

**Spectrum Analysis**

Accesses the base-instrument spectrum analyzer mode menu keys.

**GSM (w/EDGE)**

Accesses the GSM with EDGE measurement personality menu keys and associated functions.

**NOTE**

EDGE measurements require Option 252 in addition to Option BAH. If Option 252 is not installed, the EDGE measurements are not available and the measurement keys are grayed out.

Mode Setup

The **Mode Setup** front panel key provides access to front panel keys for setting up parameters that apply to all measurements for the selected mode. This contrasts to the **Meas Setup** key which provides access to parameters which are measurement specific.

**Radio...**

Provides access to a screen enabling the following parameters to be changed:

**Band/Standard**

Sets the band/standard for the measurement: P-GSM 900, E-GSM 900, R-GSM 900, DCS 1800, PCS 1900, GSM 450, GSM 480 or GSM 850. Refer to Table 3-1 on page 95 for center frequency and channel data for each band/standard.

The default is **E-GSM 900**.

**Device**

Sets the device to test: MS (mobile station), BTS (base station), uBTS M1-3 (micro base station class M1-M3) or pBTS P1 (pico base station class P1).

The default is **BTS**.

**Freq Hopping Repetition Factor**

Sets frequency hopping to **On** or **Off**, and sets the value of SFH Repeat, the repetition factor when frequency hopping is **On**. **Freq Hopping Repetition Factor** is not available and set to **Off** when Power Steps, GMSK Phase and Frequency Error, Transmit Band...
Spurious, or EDGE EVM measurements are selected. The previous settings are restored upon entering any measurement not listed above.

The defaults are Off and 3.

**DCS/PCS Overlap Priority** The DCS 1800 and PCS 1900 bands have a large number of overlapping channel numbers. Set to DCS or PCS to determine which band to use in cases of ambiguity.

*Example:* Preset the analyzer. Set DCS/PCS Overlap Priority set to DCS, then set ARFCN to 512. The DCS channel frequency is automatically set to 1805.2 MHz. Now preset the analyzer and set DCS/PCS Overlap Priority to PCS, then set ARFCN to 512. the PCS channel frequency is automatically set to 1930.2 MHz.

The default is DCS.

**R-GSM 900/GSM 850 Overlap Priority** The GSM 850 and R-GSM 900 bands have a large number of overlapping channel numbers. Set to R-GSM 900 or GSM 850 to determine which band to use in cases of ambiguity.

*Example:* Set the R-GSM 900/GSM 850 Overlap Priority to GSM 850, then enter a Channel Frequency of 876.2 MHz. The GSM 850 BTS band is automatically set to an ARFCN setting of 163.

The default is R-GSM 900.

**Input...** Provides access to a screen enabling the following parameters to be changed:

**RF Carriers** Set RF Carriers to Single if there is a single RF carrier present at the RF Input. Select Multiple if there is more than one carrier present at the RF Input. This will reject any adjacent channels for the modulation accuracy measurements. This setting is not available with the Cable Fault Location measurement.

The default is Single.

**RF Input Range** Set the RF Input Range to Auto to allow the instrument to automatically set the attenuator and reference level based on the total power level of single RF carrier input signals. If there are multiple RF carriers present, the total power might overdrive the front end. In this case, select Manual and enter the expected Max Total Power. Manual is also used if you want to hold the input attenuation constant (for the best relative power accuracy). This setting is not available with the GMSK Phase and Frequency Error, Cable Fault Location, and
EDGE EVM measurements.

The default is **Auto**.

**Max Total Power**  Sets the maximum total power at the UUT (Unit Under Test). This is the maximum expected value of the mean carrier power referenced to the output of the UUT (may include multiple carriers). The **Max Total Power** value is coupled to the **Input Attenuation** setting. This setting is not available with the GMSK Phase and Frequency Error, Cable Fault Location, and EDGE EVM measurements.

The default is −15 dBm.

**Input Attenuation**  Sets the input attenuator value. The input attenuator value is coupled to the **Max Total Power** setting. The **Input Attenuation** key reads out the actual internal input attenuator value that will be used for the current measurement. If more than one input attenuator value is used in a single measurement, the value used at the carrier frequency will be displayed. This setting is not available with the GMSK Phase and Frequency Error measurement.

The default is 5.00 dB.

---

**NOTE**  As the **Max Total Power** and **Input Attenuation** settings are coupled together, changing the input **Max Total Power** setting can change the **Input Attenuation** setting, and vice-versa for a given measurement. When you switch to a different measurement, the **Max Total Power** is kept constant, but the **Input Attenuation** may change if the two measurements have different mixer margins. Thus, you can directly set the analyzer input attenuation, or you can set it indirectly by specifying the maximum expected power at the UUT (**Max Total Power** setting).

---

**Internal Preamp**  Set to **On** to activate the internal preamplifier for additional measurement sensitivity. The measurement does not use the internal preamplifier when **Off** is selected. This setting is not available with the GMSK Phase and Frequency Error, Cable Fault Location, and EDGE EVM measurements, or when the Option 1DS: RF Preamp is not installed.

The default is **Off**.

**Mobile Gain/Attenuation**  Use to input the external gain or attenuation settings for any devices between a Mobile station UUT and the analyzer. This enables the instrument to display the measurement results referenced to the output of the UUT.
Key Reference

Mode and Mode Setup Keys

The default is 0.00 dB for both Gain and Attenuation.

Base Gain/Attenuation: Use to enter the external gain or attenuation setting for any devices between a Base station UUT and the analyzer. This enables the instrument to display the measurement results referenced to the output of the UUT.

The default is 0.00 dB for both Gain and Attenuation.

Trigger... Provides access to a screen enabling parameter changes to External, RF Burst, or Frame trigger sources.

Set the Delay, Level, and Slope for each trigger source where applicable. Delay, Level, and Slope are grayed out when not applicable. Note that the trigger source for each measurement may be selected separately (under the Meas Setup key).

Delay: For trigger delay use positive values. For pre-trigger, use negative values. The Delay setting for RF Burst is not available when Option B7E: RF Comms Hardware is not installed.

The default is 0.000 s for all trigger sources.

Level or Peak Level: For the RF Burst trigger source, the Level value is relative to the peak level of the RF signal. For External and Frame trigger sources, Level is always set to TTL.

The RF Burst setting is not available when Option B7E: RF Comms Hardware is not installed.

The default is -25 dB for RF Burst trigger source.
The default is -6 dB for RF Burst if the Option B7E: RF Comms Hardware part number is E4401-60087. (See the following note for more information.)

NOTE: Option B7E: RF Comms Hardware has at least three possible part numbers. Press System, More, Show Hdwr to show your instrument’s RF Comms Hardware and view the part number. If the part number is E4401-60087 (the original version), the Peak Level default will be -6 dB.

Slope: Select Pos (positive) to trigger on the leading edge, or Neg (negative) to trigger on the trailing edge of the signal. Slope is only available when the trigger source is set to External. The RF Burst setting is not available when Option B7E: RF Comms Hardware is not installed.

The default is Pos for all trigger sources.
NOTE

The trigger External Level, RF Burst Slope, Frame Level and Frame Slope settings are not user definable.

**Demod...**

Provides access to a screen enabling the following parameters to be changed:

- **Burst Alignment**
  Sets the sync alignment to the GSM standard, or to 1/2 Bit Offset.
  The default is GSM.

- **RF Sync Delay**
  Sets the delay or offset applied when in RF Burst alignment mode. When Burst Sync = RF Amptd, the RF Sync Delay value provides a common delay or offset of the burst alignment.
  The default is 0.000 s.

- **Burst Search Threshold**
  Sets the relative power threshold from the peak power. This setting is used by the burst alignment algorithm to determine the burst rising and falling edge when Burst Sync is set to RF Amptd or Training Sequence.
  The default is −20.00 dB.

- **IQ Invert**
  Select On to reverse the direction of the phase rotation of the internal Q signal, as required by some radio standards.
  The default is Off.

- **Opt Freq Ref**
  Sets the reference source for the DDRF assembly. Int (internal) sets the reference oscillator in the Option B7E RF Comms Hardware assembly as the reference oscillator source, Ext (external) sets the external oscillator as the reference oscillator source. This setting is not available if the Option B7E: RF Comms Hardware assembly is not installed.
  The default is Int.

- **Opt Freq Ref**
  Sets the frequency of the external reference oscillator being supplied to the Option B7E RF Comms Hardware assembly Ext Ref In jack. This provides the proper frequency division in the Option B7E RF assembly to achieve the required 10 MHz reference frequency. This setting is not available if the Option B7E: RF Comms Hardware assembly is not installed.
  The default is 10.000000 MHz.

- **Opt 10MHz Out**
  Turns the Option B7E RF Comms Hardware assembly 10 MHz Ref Out On or Off. This setting is not available if the Option B7E: RF Comms Hardware assembly is
not installed, or if Opt Freq Ref is set to Int.

The default is Off.

Properties... Provides access to a screen displaying the GSM (w/EDGE) Application Version, DSP BootROM Version, DSP GSM Code Version, and DSP EDGE Code Version.

Restore Mode Setup Defaults Restores all GSM (w/EDGE) mode parameters to factory defaults. Does not change measurement parameters.

**AMPLITUDE Y Scale**

The **Amplitude Y Scale** front panel key leads to one of the GSM with EDGE measurement display menus depending on which measurement is selected when the key is pressed.

**Transmitter Power, Power Steps, Transmitter Band Spurious, Receive Band Spurious, and Monitor Band/Channel**

**Ref Level** Sets the reference level value of the display graticule. Data can be entered in power or voltage units. When voltage units are entered, they are converted to the equivalent level in dBm.

The default is signal level dependent.

**Attenuation** Setting the **Attenuation** function to Man (manual) uncouples the input attenuator from the reference level control, and enables you to set the **Attenuation** value in 5 dB increments. **Auto** restores input attenuator coupling to the reference level control.

The defaults are Man and 5.00 dB.

**Scale/Div** Sets the vertical amplitude scaling (per division) of the display graticule.

The default is 10.00 dB.

**GMSK and EDGE Power versus Time**

**NOTE** The Amplitude Y Scale keys for GMSK and EDGE Power vs Time are available only when a graph window has been selected as the active window. Any other active window selection results in a blank Amplitude Y Scale key menu.

**Scale/Div** Sets the vertical amplitude scaling (per division) of the display graticule.
The default is 10.00 dB for all measurement views except ‘On’ Burst. The default is 0.50 dB for GMSK ‘On’ Burst view. The default is 3.00 dB for EDGE ‘On’ Burst view.

**Ref Value**
Sets the reference level value of the display graticule. Data can be entered in power or voltage units. When voltage units are entered, they are converted to the equivalent level in dBm.

The default is signal level dependent.

**Ref Position**
Sets the position of the reference level to either the Top, Ctr (center), or Bot (bottom) of the display graticule.

The default is Top.

**GMSK Phase and Frequency**

**Scale/Div**
Sets the vertical amplitude scaling (per division) of the display graticule.

The default is 10.00 dB.

**Ref Value**
Sets the reference level value of the display graticule. Data can be entered in power or voltage units. When voltage units are entered, they are converted to the equivalent level in dBm.

The default is signal level dependent.

**Ref Position**
Sets the position of the reference level to either the Top, Ctr (center), or Bot (bottom) of the display graticule.

The default is Top.

**Cable Fault Location**

**Scale/Div**
Sets the vertical amplitude scaling (per division) of the display graticule.

The default is 10.00 dB.

**Ref Value**
Sets the reference level value of the display graticule. Data can be entered in power units only.

The default is signal level dependent.

**Ref Position**
Sets the position of the reference level to either the Top, Ctr (center), or Bot (bottom) of the display graticule.

The default is Top.
Out of Band Spurious

Ref Level
Sets the reference level value of the display graticule. This key is not available if Inspect Spur has not been selected.

The default is 0.00 dBm.

Atten
Sets the input attenuator value in 5 dB increments. This key is not available if Inspect Spur has not been selected.

The default is 0.00 dB.

EDGE EVM I/Q Error (Quad View)

Scale/Div
Sets the vertical amplitude scaling (per division) of the Phase Error, Magnitude or EVM display graticule. Scaling is in degrees for Phase Error, and percentage for Magnitude and EVM.

The default is 1.00° for the Phase Error graticule.
The default is 1.00 % for the Magnitude and EVM graticule.

Ref Value
Sets the reference level value of the Phase Error, Magnitude or EVM display graticule. The reference value is in degrees for Phase Error, and percentage for Magnitude and EVM.

The default is 0.00° for the Phase Error graticule.
The default is 0.00 % for the Magnitude and EVM graticule.

Ref Position
Sets the position of the reference level to either the Top, Ctr (center), or Bot (bottom) of the Phase Error, Magnitude or EVM display graticule.

The default is Ctr for the Phase Error and Magnitude graticules.
The default is Bot for the EVM graticule.

FREQUENCY Channel

The FREQUENCY Channel front panel key provides access to menu keys which control the center frequency or channel number to be used for measurements. These parameters apply to all measurements in the current mode.

ARFCN
Sets the Absolute RF Channel Number to be measured for the selected band. ARFCN is coupled with Channel Freq—setting ARFCN updates Channel Freq to the value corresponding to that ARFCN. Range is limited to valid channels for the selected band.

The default is 38.

Channel Freq
Sets the channel frequency to be measured for the selected band. Channel Freq is coupled with ARFCN—setting Channel Freq updates the ARFCN value to the closest channel number corresponding to that frequency. If the Channel Freq value entered does not exactly correlate
with an ARFCN, the softkey label displays a > or < symbol to indicate whether the channel frequency is above or below that ARFCN.

The default is 942.600 MHz.

**BMT ARFCN**

Leads to a menu that lets you quickly set the **Bottom**, **Middle**, or **Top** ARFCN and corresponding Channel Freq from a subset of the available ARFCN numbers, as shown in Table 3-1.

**Table 3-1**

<table>

</tbody>
</table>

Note that the above values apply when **Device** is set to BTS. When **Device** is set to MS, **ARFCN** values are the same but **Channel Freq** values are different.

**Auto ARFCN**

Invokes the Auto ARFCN routine which locates the strongest signal and sets the RF Channel Frequency, ARFCN, and Band accordingly.

**Timeslot**

Leads to a menu with the following Reference Time Slot parameters:

- **Timeslot**
  
Sets the specific time slot (0 to 7) for the demodulation measurement, and toggles the time slot function **On** or **Off**. The key is grayed out if Options B7D and B7E are not installed, or if trigger source is not set to external or frame.

The defaults are **Off** and 0.

- **Ref Burst**
  
Sets one of the following types of bursts to be used as the frame reference burst: **Normal** (TCH & CCH), **Sync** (SCH) or **Access** (RACH). The key is not available if Options B7D and B7E are not installed, or if trigger source is not set to frame.

The default is **Normal** (TCH & CCH).
Key Reference
Mode and Mode Setup Keys

**Ref TSC (Std)**
Sets the Training Sequence Code frame reference to Auto or Man (manual), and sets the TSC value. Auto selects the first burst found to have any one of the valid TSCs in the range of 0-7 to be the frame reference burst. Man sets the entered TSC value as the frame reference burst. The key is not available if Options B7D and B7E are not installed, if trigger source is not set to frame, or when Ref Burst other than Normal (TCH & CCH) is selected.

The defaults are Auto and 0.

**Burst Type**
Sets the type of burst to be measured to one of the following options: Normal (TCH & CCH), Sync (SCH) or Access (RACH). The key is not available if Options B7D and B7E are not installed.

The default is Normal (TCH & CCH).

**TSC (Std)**
Auto Man
Sets the TSC (Training Sequence Code) to Auto or Man (manual), and sets the TSC value. The key is not available if Options B7D and B7E are not installed, or when a Ref Burst other than Normal (TCH & CCH) is selected.

The defaults are Auto and 0.

**SPAN X Scale**
The SPAN X Scale front panel key leads to one of the GSM/EDGE measurement display menus depending on which measurement is selected when the key is pressed.

**Cable Fault Location**

**Scale/Div**
Sets the horizontal distance scaling (per division) of the display graticule.

The default is 2.00 m.

**Ref Value**
Sets the horizontal reference position value.

The default is 0.00 m.

**Ref Position**
Sets the reference position to either the Left, Ctr (center), or Right side of the display graticule.

The default is Left.

**GMSK Phase and Frequency**

**Scale/Div**
Sets the horizontal time scaling (per division) of the display graticule.

The default is 500 µs.
Ref Value
Sets the horizontal reference time value.
The default is 0.000 s.

Ref Position
Sets the reference time position to either the Left, Ctr (center), or Right side of the display graticule.
The default is Left.

GMSK and EDGE Power versus Time

NOTE
The Span X Scale keys described for GMSK and EDGE Power vs Time measurements are available only when a graph window has been selected as the active window. Any other active window selection results in a blank Span X Scale key menu.

Scale/Div
Sets the horizontal time scaling (per division) of the display graticule.
The default is 66.28 µs for the Monitor, Mask, and ‘On’ Burst view graticules.
The default is 5.000 µs for the Rise & Fall view graticules.

Ref Value
Sets the horizontal reference time value.
The default is –60.00 µs for the Monitor, Mask, and ‘On’ Burst view graticules.
The default is –30.00 µs for the Rise & Fall view rise graticule, and 524.00 µs for the Rise & Fall view fall graticule.

Ref Position
Sets the reference position to either the Left, Ctr, (Center) or Right side of the display graticule.
The default is Left.

Marker
Marker functions are not available with the following measurements:

- GMSK Output RF Spectrum
- GMSK Phase and Frequency
- EDGE Error Vector Magnitude
- EDGE Output RF Spectrum

Basic marker functionality is provided with the Cable Fault Location, GMSK Power vs. Time, and EDGE Power vs. Time measurements.

For the remaining GSM/EDGE measurements, functions accessed by the Marker key are identical to those accessed in Spectrum Analysis mode. For further information refer to the Agilent ESA User’s and Programmer’s Reference.
Measurement Keys

The GSM and GSM w/EDGE modes include many different measurements and each measurement has a unique set of adjustable functions that are measurement specific.

MEASURE

The MEASURE front panel key provides access to menu keys which enable you to make the following measurements:

- Transmitter Power
- Power Steps
- GMSK Power versus Time
- GMSK Phase And Frequency Error
- GMSK Output RF Spectrum
- Cable Fault Location
- Transmit (Tx) Band Spurious
- Receive (Rx) Band Spurious
- Out Of Band Spurious
- Monitor Band/Channel
- EDGE Power versus Time
- EDGE EVM (Error Vector Magnitude)
- EDGE Output RF Spectrum

Meas Setup

The Meas Setup front panel key displays a menu that allows you to enter custom setup parameters for a measurement. The setup menu displayed depends on the measurement selected from the MEASURE menu.

Display

The Display front panel key leads to one of the GSM/EDGE measurement display menus, depending on which measurement is selected when the key is pressed.

View/Trace

The View/Trace front panel key leads to one of the GSM/EDGE measurement view/display menus depending on which measurement is selected when the key is pressed. Used to select between different measurement views where appropriate.
Transmitter Power

Meas Setup (Transmitter Power)

To access the keys for setting up a transmitter power measurement, press MEASURE, Transmit Power, and then the front panel Meas Setup key.

Avg Number

Toggles measurement averaging On or Off, and sets the number of measurement averages used to calculate the measurement result when On is selected. After the specified number of averages has been reached, the Avg Mode termination control setting determines the averaging action.

The defaults are On and 10.

Avg Mode

Sets the termination control method used for the averaging function. The termination control methods are:

Exp

Exponential averaging. After the number of averages specified by Avg Number has been reached, each successive data acquisition is exponentially weighted and combined with the existing average.

Repeat

Repeat averaging. After the number of averages specified by Avg Number has been reached, the averaging is reset and a new average is started.

The default is Exp.

Average Type

Sets the type of averaging to be performed.

Video

Sums the trace data and divides by the number of averages specified in Avg Number.

Power

Converts the trace data from dB to power units, then averages the power trace data. This is more time consuming than Video averaging.

The default is Power.

Threshold Lvl

Sets the threshold level to Abs (absolute in dBm), or Rel (relative in dB) to the carrier. A green line on the trace area will be displayed at the Y-position associated with the current threshold level value, which is converted to the current amplitude display units.

The defaults are –6 dB and Rel.

Trig Source

Sets the trigger source for the transmitter power measurement. Choose one of the following trigger sources:

Free Run (Immediate) Trigger occurs at the time the data is requested, completely asynchronous to the RF or IF signal.
Key Reference
Measurement Keys

**External**
Activates the rear panel external trigger input. The external trigger must be a TTL signal.

**RF Burst (Wideband)**
Activates an internal wideband RF burst trigger that has an automatic level control for burst signals. It triggers on a level that is relative to the peak of the RF burst.

**Frame**
Uses the internal frame clock to generate a trigger signal. The clock parameters are controlled under the Mode Setup key or the measurement firmware, but not both. See the specific measurement for details.

The default is **RF Burst (Wideband)** when hardware Options B7D and B7E are installed, otherwise the default is **External**.

**NOTE**
RF Burst (Wideband) and Frame are available only when hardware Options B7D and B7E are installed.

**Burst Sync**
Sets the synchronization of the measurement to the correct part of the burst. Choose one of the following synchronization methods:

- **Training Seq (GMSK Only)**
  Synchronizes the measurement to the timing of the demodulated training sequence of the burst. This is the most precise method, but requires a burst with a valid TSC (Training Sequence Code). This key is grayed out and not available if hardware Options B7D and B7E are not installed. This synchronization method supports GMSK transmitter power measurements only.

- **RF Amptd (GMSK Only)**
  Synchronizes the measurement to the burst transition of the measured RF carrier. This synchronization method supports GMSK transmitter power measurements only.

- **None**
  Uses the start of the time record as the start of the useful part of the burst. This synchronization method supports both EDGE and GMSK transmitter power measurements.

The default is **None**.

**Meas Time**
Sets the number of slots displayed. Up to 8 time slots can be displayed on the trace with each measurement cycle. This measurement is closely tied to sweep time.

The default is 1 slot.

**Restore Meas Defaults**
Restores all Meas Setup parameter values for the current measurement to their factory defaults.

**Advanced**
Provides access to the following advanced measurement parameter
settings:

**Res BW**  Sets the 3 dB resolution bandwidth in a 1, 3, 10 sequence.

The default is 300 kHz.

**Video BW**  Sets the analyzer post detection filter in a 1, 3, 10 sequence.

The default is 300 kHz.

**Display (Transmitter Power)**

**Current Data**  The values for Mean Transmit Power, Max Pt, and Min Pt for the current trace are calculated and displayed on the results screen by default. **Current Data** toggles the calculation and display of these values **On** or **Off**. The measurement executes faster when the parameter is set to off.

The default is **On**.

**View Trace (Transmit Power)**

**RF Envelope**  Shows measurement results in an RF Envelope data view.

**Power Steps**

**Meas Setup (Power Steps)**

To access the keys for setting up a power steps measurement, press **MEASURE**, **Power Steps**, and then the front panel **Meas Setup** key.

**Sweep Time**  Sets the length of the measurement interval.

The default is 2.000 s.

**Marker Delta**  Sets the marker separation distance. The distance between markers is displayed in time as the power steps measurement is performed in zero span. The results are updated as soon as the marker positions are changed.

**Marker Center**  Moves the delta marker’s position on the trace without affecting the separation distance. The position is in time as the power steps measurement is performed in zero span. The results are updated as soon as the marker positions are changed.

**Limit Test**  Sets the active limit checking of numeric phase and frequency error results to **On** or **Off**—this does not turn on or off the limit lines which are accessed through the **Display** front panel key menu.
The default setting is **On**.

### Limits....

- **Upper Limit**
  - The absolute power step value must be less than or equal to this limit. If it exceeds it, the power step result is displayed in red and appended with a “F”.
  - The default is 3.5 dB.

- **Lower Limit**
  - The absolute power step value must be greater than or equal to this limit. If it is less, the power step result is displayed in red and appended with a “F”.
  - The default is 0.5 dB.

### Restore Meas Defaults

Restores all **Meas Setup** parameter values for the current measurement to their factory defaults.

### Advanced

Provides access to the following advanced measurement parameter settings:

- **Res BW**
  - Sets the 3 dB resolution bandwidth in a 1, 3, 10 sequence.
  - The default is 1 MHz.

- **Video BW**
  - Sets the analyzer post detection filter in a 1, 3, 10 sequence.
  - The default is 300 kHz.

### View Trace (Power Steps)

**Numeric Results**

Shows measurement results with a numeric data view.

### GMSK Power versus Time

**Meas Setup (GMSK Power versus Time)**

To access the keys for setting up a GMSK power versus time measurement, press **MEASURE, GMSK Pwr vs Time**, and then the front panel **Meas Setup** key.

**Avg Number**

Toggles measurement averaging **On** or **Off**, and sets the number of measurement averages used to calculate the measurement result when **On** is selected. After the specified number of averages has been reached, the **Avg Mode** termination control setting determines the averaging action.

The defaults are **Off** and 10.
Avg Mode
Sets the termination control method used for the averaging function.
The termination control methods are:

Exp     Exponential averaging. After the number of averages
        specified by Avg Number has been reached, each
        successive data acquisition is exponentially weighted
        and combined with the existing average.

Repeat Repeat averaging. After the number of averages
        specified by Avg Number has been reached, the
        averaging is reset and a new average is started.

The default is Exp.

Average Type
Sets the type of averaging to be performed.

Video Sums the trace data and divides by the number of
       averages specified in Avg Number.

Power Converts the trace data from dB to power units, then
        averages the power trace data. This is more time
        consuming than Video averaging.

The default is Power.

Meas Time
Sets the number of slots displayed. Up to 8 time slots can be displayed
on the trace with each measurement cycle. This measurement is closely
 tied to sweep time.

The default is 1 slot.

Trig Source
Sets the trigger source for the GMSK power versus time measurement.
Choose one of the following trigger sources:

Free Run (Immediate) This key is not available with this measurement.

External Activates the rear panel external trigger input. The
        external trigger must be a TTL signal.

RF Burst (Wideband) Activates an internal wideband RF burst trigger
        that has an automatic level control for burst signals. It
        triggers on a level that is relative to the peak of the RF
        burst.

Frame Uses the internal frame clock to generate a trigger
        signal. The clock parameters are controlled under the
        Mode Setup key or the measurement firmware, but not
        both.

The default is RF Burst (Wideband) when hardware Options B7D and
B7E are installed, otherwise the default is External.

NOTE RF Burst (Wideband) and Frame are available only when hardware
Options B7D and B7E are installed.
**Measurement Keys**

- **Burst Sync**: Sets the synchronization of the measurement to the correct part of the burst. Choose one of the following synchronization methods:
  - **Training Seq**: Synchronizes the measurement to the timing of the demodulated training sequence of the burst. This is the most precise method, but requires a burst with a valid TSC (Training Sequence Code). This key is grayed out and not available if hardware Options B7D and B7E are not installed.
  - **RF Amptd**: Synchronizes the measurement to the burst transition of the measured RF carrier.
  - **None**: Uses the start of the time record as the start of the useful part of the burst.

The default is **Training Seq** when hardware Options B7D and B7E are installed, otherwise the default is **RF Amptd**.

- **Pwr Ctrl Lvl**: Sets the output power of the transmitter when testing MS devices. The appropriate power level for measuring the device under test will correspond with the transmitter power control level setting. **Pwr Ctrl Lvl** does not affect BTS limit masks.

  The default is **0**.

- **Max Hold**: Toggles trace maximum hold **On** or **Off** while the **Monitor** view is enabled. With any other view, **Max Hold** is grayed out and set to **Off**. The last state is restored if you exit to another view and then return to **Monitor** view.

  The default is **Off**.

- **Limit Test**: Toggles active limit checking **On** or **Off**—this does not turn on or off the limit lines, which are accessed through the **Display** front panel key menu.

  The default is **On**.

- **Restore Meas Defaults**: Restores all **Meas Setup** parameter values for the current measurement to their factory defaults.

- **Advanced**: Provides access to the following advanced measurement parameter settings:
  - **Res BW**: Sets the 3 dB resolution bandwidth in a 1, 3, 10 sequence.
    
    The default is 300 kHz.

  - **Video BW**: Sets the analyzer post detection filter in a 1, 3, 10 sequence.
    
    The default is 300 kHz.
Trace Points

Leads to a menu listing the available trace point samples that can be selected for the measurement:

- **401 samples**: Provides fastest measurement times, with lowest resolution.
- **801 samples**: Provides faster measurement times with less resolution.
- **1601 samples**: Optimizes measurement time and accuracy.
- **3201 samples**: Recommended setting for the Rise & Fall view.
- **6401 samples**: Provides highest accuracy with slowest measurement times.

The default is **1601 samples**.

Sweep Time

Shows the sweep time used for the current Meas Time parameter setting. This information can be used with the Trace Points setting to help calculate the burst mask alignment uncertainty. The key is available only for viewing sweep time.

The default is **720 µs**.

Display (GMSK Power versus Time)

- **Limit Display**: Toggles the limit mask display **On** or **Off**. This does not affect any calculations that are taking place.
  
  The default is **On**.

- **Current Data**: The values for Mean Transmit Power, Max Pt, and Min Pt for the current trace are calculated and displayed on the results screen by default. Current Data toggles the calculation and display of these values **On** or **Off**. The measurement executes faster when the parameter is set to **Off**.
  
  The default is **On**.

View Trace (GMSK Power versus Time)

- **Mask**: Select Mask view to analyze a complete burst and compare it to the set of upper and lower limit lines specified by the 3GPP Standards, or to custom sets of upper and lower limit lines that can be constructed using SCPI commands (see the Programming Commands chapter for more information). Max Hold and Full Screen are not available with this view.

- **Monitor**: Select Monitor to view up to 8 time slots (an entire frame). Limit Display lines are not available in this view.
Rise & Fall

Select **Rise & Fall** to zoom in on the rising and falling portions of the current time slot. **Markers**, **Max Hold**, and **Full Screen** are not available with this view.

‘On’ Burst

Select ‘On’ **Burst** to view the portion of the burst which lies between the rising and falling edges. **Markers**, **Max Hold**, and **Full Screen** are not available with this view.

The default is **Mask**.

### GMSK Phase and Frequency Error

**Meas Setup (GMSK Phase and Frequency Error)**

To access the keys for setting up a GMSK phase and frequency error measurement, press **MEASURE**, **GMSK Phase & Freq**, and then the front panel **Meas Setup** key.

**NOTE**

The GMSK Phase and Frequency Error measurement is not available when hardware Options B7D and B7E are not installed.

**Avg Number**

Toggles measurement averaging **On** or **Off**, and sets the number of measurement averages used to calculate the measurement result when **On** is selected. After the specified number of averages has been reached, the **Avg Mode** termination control setting determines the averaging action.

The defaults are **Off** and 10.

**Avg Mode**

Sets the termination control method used for the averaging function. The termination control methods are:

- **Exp**
  
  Exponential averaging. After the number of averages specified by **Avg Number** has been reached, each successive data acquisition is exponentially weighted and combined with the existing average.

- **Repeat**
  
  Repeat averaging. After the number of averages specified by **Avg Number** has been reached, the averaging is reset and a new average is started.

The default is **Exp**.

**Average Type**

Sets the type of averaging to be performed.

- **Mean**
  
  The mean values are restored (the average of all values is retained).

- **Maximum**
  
  The maximum values are restored (the maximum of all values is retained).
The default setting is **Maximum**.

**Trig Source**

Sets the trigger source for phase and frequency measurement. Choose one of the following trigger sources:

- **Free Run (Immediate)**: Trigger occurs at the time the data is requested, completely asynchronous to the RF or IF signal.
- **RF Burst (Wideband)**: Activates an internal wideband RF burst trigger that has an automatic level control for burst signals. It triggers on a level that is relative to the peak of the RF burst.
- **External**: Activates the rear panel external trigger input. The external trigger must be a TTL signal.
- **Frame**: Uses the internal frame clock to generate a trigger signal. The clock parameters are controlled under the **Mode Setup** key or the measurement firmware, but not both.

The default is **RF Burst (Wideband)** when hardware Options B7D and B7E are installed, otherwise the default is **External**.

**NOTE**

**RF Burst (Wideband)** and **Frame** are available only when hardware Options B7D and B7E are installed.

**Burst Sync**

Sets the synchronization of the measurement to the correct part of the burst. Choose one of the following synchronization methods:

- **Training Seq**: Synchronizes the measurement to the timing of the demodulated training sequence of the burst. This is the most precise method, but requires a burst with a valid TSC (Training Sequence Code). This key is grayed out and not available if hardware Options B7D and B7E are not installed.
- **RF Amptd**: Synchronizes the measurement to the burst transition of the measured RF carrier.
- **None**: Uses the start of the time record as the start of the useful part of the burst.

The default is **Training Seq** when hardware Options B7D and B7E are installed, otherwise the default is **RF Amptd**.

**Limit Test**

Toggles the active limit checking of numeric phase and frequency error results **On** or **Off**—this does not turn on or off the limit lines, which are accessed through the **Display** front panel key menu.

The default is **On**.

**Limits....**

Leads to a screen with the following settings:
RMS Phase Limit  The RMS phase error must be less than or equal to this limit. If the RMS phase error exceeds it, the measurement display shows the RMS phase error in red and appends a red “F” to the value.

The default is 5.00 °rms.

Peak Phase Limit  The peak phase error must be less than or equal to this limit. If the peak phase error exceeds it, the measurement display shows the peak phase error in red and appends a red “F” to the value.

The default is 20.00 °pk.

Frequency Limit  The frequency error must be less than or equal to this limit. If the frequency error exceeds it, the measurement display shows the frequency error in red and appends a red “F” to the value.

The default is 0.05 ppm for BTS, and 0.1 ppm for MS and pBTS.

Restore Meas Defaults  Restores all Meas Setup parameter values for the current measurement to their factory defaults.

Display (GMSK Phase and Frequency)

Bit Dots (Constellation)  Toggles the display of the measured values used to calculate the constellation view On or Off. When set to On, the values (coordinates) are superimposed on the constellation.

The default is On.

Bit Dots (Graph)  Toggles the display of the measured values used to calculate the graphical view On or Off. When set to On, these values (coordinates) are superimposed on the graph.

The default is Off.

View Trace (GMSK Phase and Frequency)

I/Q Error (Quad View)  Sets the display to I/Q Error Quad view.

I/Q Measured Polar Vector  Sets the display to I/Q Measured Polar Vector view.

Numeric Results  Shows measurement results with a numeric data view.
GMSK Output RF Spectrum

Meas Setup (GMSK Output RF Spectrum)

To access the keys for setting up a GMSK output RF spectrum measurement, press MEASURE, GMSK Output RF Spectrum and then the front panel Meas Setup key.

Avg Number

Toggles measurement averaging On or Off, and sets the number of measurement averages used to calculate the measurement result when On is selected. After the specified number of averages has been reached, the Avg Mode termination control setting determines the averaging action.

The defaults are Off and 10.

Avg Mode

Sets the termination control method used for the averaging function. The Avg Mode key is grayed out and set to Repeat when the Multi-Offset measurement method is selected. The previous Avg Mode state is restored upon exiting Multi-Offset.

The termination control methods are:

Exp

Exponential averaging. After the number of averages specified by Avg Number has been reached, each successive data acquisition is exponentially weighted and combined with the existing average.

Repeat

Repeat averaging. After the number of averages specified by Avg Number has been reached, the averaging is reset and a new average is started.

The default is Repeat.

Meas Method

Leads to a menu with the following measurement method selections:

Multi-Offset

 Automatically makes measurements at all offset frequencies listed in the Standard or Short frequency list. (See Table 3-2, “Offset Frequency Lists.”)

Single Offset (Examine)

Makes a measurement at a single offset frequency as set by the Offset Freq softkey.

Swept

Sets the trigger source to Free Run, and disables the Trigger Source softkey when selected. The Trigger Source state is restored when measurement method is returned to Single Offset or Multi-Offset.

The default is Multi-Offset.

Meas Type

Toggles the measurement type between Mod (Output RF Spectrum due to modulation), and Switch (Output RF Spectrum due to switching transients or burst ramping).

The default is Mod.
**Key Reference**  
**Measurement Keys**

**Ofs Freq List**  
Set to **Std** (standard) or **Short** to define which frequency offsets to scan. See Table 3-2, “Offset Frequency Lists.” **Ofs Freq List** is not available when **Meas Method** is set to **Single Offset** or **Swept**.

The default is **Short**.

**Table 3-2**  
**Offset Frequency Lists**

<table>
<thead>
<tr>
<th>List</th>
<th>Modulation Offsets (kHz)</th>
<th>Switching Offsets (kHz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Std (Standard)</td>
<td>100, 200, 250, 400, 600, 800, 1000, 1200, 1400, 1600, 1800, 3000, 6000</td>
<td>400, 600, 1200, 1800</td>
</tr>
<tr>
<td>Short</td>
<td>200, 250, 400, 600, 1200, 1800</td>
<td>400, 600, 1200, 1800</td>
</tr>
</tbody>
</table>

**Offset Freq**  
Sets a frequency offset from the carrier at which to perform a single offset Output RF Spectrum measurement. **Offset Freq** is not available when **Meas Method** is set to **Multi-Offset** or **Swept**.

The default is 250 kHz.

**Trig Source**  
Sets the trigger source for the GMSK ORFS measurement. The **Trig Source** key is grayed out and set to **External** when the **Swept** measurement method is selected. The previous **Trigger Source** state is returned when the measurement method is returned to **Single Offset** or **Multi-Offset**. Choose one of the following trigger sources:

- **Free Run (Immediate)**: Allows trigger to occur at the time the data is requested, completely asynchronous to the RF or IF signal. This key is not available if **Single Offset** or **Multi-Offset** measurement method is selected.

- **RF Burst (Wideband)**: Activates an internal wideband RF burst trigger that has an automatic level control for burst signals. It triggers on a level that is relative to the peak of the RF burst.

- **External**: Activates the rear panel external trigger input. The external trigger must be a TTL signal.

- **Frame**: Uses the internal frame clock to generate a trigger signal. The clock parameters are controlled under the **Mode Setup** key or the measurement firmware, but not both.

The default is **RF Burst** when hardware Options B7D and B7E are installed, otherwise the default is **External**.

**NOTE**  
**RF Burst (Wideband)** and **Frame** are available only when hardware Options B7D and B7E are installed.
Burst Sync

Sets the synchronization of the measurement to the correct part of the burst. Choose one of the following synchronization methods:

**Training Seq**
Synchronizes the measurement to the timing of the demodulated training sequence of the burst. This is the most precise method, but requires a burst with a valid TSC (Training Sequence Code). This key is not available if hardware Options B7D and B7E are not installed.

**RF Amptd**
Synchronizes the measurement to the burst transition of the measured RF carrier.

**None**
Uses the start of the time record as the start of the useful part of the burst.

The default is **Training Seq** when hardware Options B7D and B7E are installed, otherwise the default is **RF Amptd**.

Widebnd Noise

Sets the frequency range that is swept on either side of the carrier center frequency. Available only when **Meas Type** is set to **Mod** and measurement method is **Swept**.

**On**
The analyzer tunes to the carrier, and the whole relevant band plus 2 MHz either side of center frequency is swept.

**Off**
The analyzer tunes to the carrier, and 1800 kHz below and above either side of the center frequency is swept.

The default is **Off**.

Restore Meas Defaults

Restores all **Meas Setup** parameter values for the current measurement to their factory defaults.

Advanced

Provides access to the following advanced measurement parameter settings:

**Ref Pwr Avg**
Sets the number of averages to be taken when determining the reference power (at 0 Hz offset). Available only when **Meas Method** is set to **Single Offset**.

**Auto**
Uses the number of averages equal to that specified in the **Avg Number** parameter.

**Manual**
Lets you manually specify the number of averages.

The defaults are **Auto** and 10.

**Max Mxr Lvl**
Sets the maximum power at the RF mixer input. The instrument will automatically set the optimum attenuation value based on the value entered.
Measurement Keys

The default is $-4.00 \text{ dBm}$.

**Mod BWs**

Leads to a menu with custom RBW settings that deviate from the GSM standard for ORFS due to modulation:

- **<1800 kHz Offset RBW** Sets the RBW for measuring offsets of less than 1800 kHz.
  
  The default is 30 kHz.

- **≥1800 kHz Offset RBW** Sets the RBW for measuring offsets greater than or equal to 1800 kHz.
  
  The default is 100 kHz.

**Switch BWs**

Leads to a menu with custom RBW settings that deviate from the GSM standard for ORFS due to switching:

- **<1800 kHz Offset RBW** Sets the RBW for measuring offsets of less than 1800 kHz.
  
  The default is 30 kHz.

- **≥1800 kHz Offset RBW** Sets the RBW for measuring offsets greater than or equal to 1800 kHz.
  
  The default is 30 kHz.

- **<1800 kHz VBW** Sets the video BW for measuring offsets of less than 1800 kHz.
  
  The default is 100 kHz.

- **≥1800 kHz VBW** Sets the video BW for measuring offsets greater than or equal to 1800 kHz.
  
  The default is 100 kHz.

**Display (GMSK Output RF Spectrum)**

When the measurement method is set to Multi-Offset, the results table can be changed to show any of the following sets of values:

- **Rslt** Displays the actual measurement results.
- **Lim** Displays the absolute and relative limits for all offsets.
- **Mrgn** Displays the margin by which the result meets specifications. Negative numbers indicate that the result has failed.

The default is **Rslt**.
View Trace (GMSK Output RF Spectrum)

**Numeric Results**

Shows measurement results with a numeric data view. **Numeric Results** are not available unless **Meas Method** = **Multi-Offset**.

Cable Fault Location

**Meas Setup (Cable Fault Location)**

To access the keys for setting up a cable fault location measurement, press **MEASURE, Cable Fault Location**, and then the front panel **Meas Setup** key.

---

**NOTE**

Upon entering the Cable Fault Location measurement, a screen appears prompting you to connect a power divider between the cable under test, the analyzer RF input, and the tracking generator output. Press **ESC** or **Meas Setup** to exit the screen.

---

**Avg Number**

Toggles measurement averaging **On** or **Off**, and sets the number of measurement averages used to calculate the measurement result when **On** is selected. After the specified number of averages has been reached, the **Avg Mode** termination control setting determines the averaging action.

The defaults are Off and 10.

**Avg Mode**

Sets the termination control method used for the averaging function. The termination control methods are:

- **Exp**
  
  Exponential averaging. After the number of averages specified by **Avg Number** has been reached, each successive data acquisition is exponentially weighted and combined with the existing average.

- **Repeat**

  Repeat averaging. After the number of averages specified by **Avg Number** has been reached, the averaging is reset and a new average is started.

  The default is **Exp**.

**Calibrate**

Leads to the calibration setup screen. Follow the screen instructions to calibrate the measurement. Calibrate removes any errors introduced by the cabling and components of the test setup.

- **Continue**

  Press once after the test setup has been connected to calibrate the spectrum analyzer.

- **Cancel**

  Aborts the calibration screen and menu.

**Cable Type**

Leads to the Cable Editor form and menu. Set the type and parameters...
Key Reference
Measurement Keys

of the cable being tested:

**Cable**
Select an entry in the cable type table. Accepts numeric values.

**Vel Factor**
Set the velocity factor for the cable type selected. The field's numeric value represents a proportion of the speed of light. The value can be edited and saved using the **Store Table** key.

**Cable Loss/m**
Set the amount of signal lost per meter for the cable type selected, expressed in dB. The value can be edited and saved using the **Store Table** key.

**Store Table**
Saves any changes made to the **Cable**, **Vel Factor** or **Cable Loss/m** parameters.

**Start Distance**
Sets the starting point (in meters) for the cable fault measurements. The default is 0.00 m.

**Stop Distance**
Sets the finishing point (in meters) for the cable fault measurements. The default is 20.0 m.

---

**NOTE**
The **Stop Distance** should normally be set to slightly more than the full length of the cable being tested.

**Trace Points**
Sets the number of trace points used in the measurement. The analyzer determines the optimum setting in **Auto**. Use **Man** to set the number of trace points manually. Changing the number of trace points affects the minimum and maximum measurable distances. As a general rule, the longer the cable, the more trace points you should use. It is possible to select up to 8192 trace points but due to the computational intensive FFT, the higher the value, the slower the measurement becomes. To ensure the fastest possible speed, use a value that is a power of 2—for example 512, 1024 and so on.

The defaults are **Auto** and 512.

**Window**
Leads to a menu of FFT windowing functions. The cable fault measurement uses an FFT to convert the analyzer frequency trace into a distance trace. To get the best possible results from the FFT, it is important to apply the most suitable windowing function to the frequency trace before performing the FFT. Select from **Rectangular**, **Flat Top**, **Gaussian**, or **Hanning**. The following table describes these values.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Max Side-Lobe Level</th>
<th>Side-Lobe Roll Off</th>
<th>Max Main</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rectangular</td>
<td>Results in no windowing.</td>
<td>–13.261 dB</td>
<td>20 dB/decade</td>
<td>–3.9224 dB</td>
</tr>
</tbody>
</table>
The default is **Flat Top**.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Max Side-Lobe Level</th>
<th>Side-Lobe Roll Off</th>
<th>Max Main</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flat Top (default)</td>
<td>The five term flat-top window.</td>
<td>−95.1 dB</td>
<td></td>
<td>±0.002077456085 dB</td>
</tr>
<tr>
<td>Gaussian</td>
<td>A five term cosine window that resembles a Gaussian window.</td>
<td>−125.4 dB</td>
<td></td>
<td>−0.680056 dB</td>
</tr>
<tr>
<td>Hanning</td>
<td>Has a good frequency resolution and reasonably good side-lobe roll-off, but poor main-lobe flatness and relatively large side-lobe peaks.</td>
<td>−31.46730784 dB</td>
<td>60 dB/decade</td>
<td>−1.423622 dB</td>
</tr>
</tbody>
</table>

**Restore Meas Defaults**
Restores all **Meas Setup** parameter values for the current measurement to their factory defaults.

**Advanced**
Provides access to the following advanced measurement parameter settings:

- **Res BW**
  Sets the resolution bandwidth for the measurement and defines whether it is Auto or **Man (manual)**.
  The defaults are **Auto** and 3 MHz.

- **Video BW**
  Sets the video bandwidth for the measurement and defines whether it is Auto or **Man (manual)**.
  The defaults are **Auto** and 3 MHz.

- **TG Amplitude**
  Sets the power level of the internal source.
  The default is −10.00 dBm.

**View Trace (Cable Fault Location)**

**FFT**
Shows FFT data view.

**Transmit Band Spurious**

**Meas Setup (Transmit Band Spurious)**
To access the keys for setting up a transmit band spurious measurement, press **MEASURE, Tx Band Spurs**, and then the front panel **Meas Setup** key.

**Avg Number**
Toggles measurement averaging **On** or **Off**, and sets the number of
measurement averages used to calculate the measurement result when On is selected. After the specified number of averages has been reached, the Avg Mode termination control setting determines the averaging action.

The defaults are Off and 10.

**Avg Mode**

This key is always grayed out for this measurement and cannot be accessed. It shows that the averaging action taken after reaching the number of averages set with Avg Number is always Repeat (the averaging is reset and a new average is started).

**Meas Type**

Sets one of the measurement types described below:

- **Examine**
  A full measurement is performed on all segments to find the segment with the worst spur. The measurement then selects and continuously updates that segment. While set to Examine, any of the other segments can be selected using the View/Trace menu.

- **Full**
  In continuous measure, the measurement repeatedly does a full search of all segments.

  The default is Full.

**MS Idle**

Sets the correct specification limits, depending on whether there is an active mobile station carrier or not. MS Idle is coupled to the Limit parameter. This setting is not available unless Device Type is set to MS in the Radio Mode setup menu.

- **On**
  Use this setting when no active mobile station carrier is present to force the measurement to use the correct limits.

- **Off**
  Limits are set to the correct values when an active mobile station carrier is present.

  The default is Off.

**Limit**

Sets the upper limit value for testing spurs. The default setting is based on the 3GPP Standard Specifications. It changes depending on the MS Idle mode, Band/Standard, and Device settings.

The default is –36 dBm with measurement set to factory defaults.

**Restore Meas Defaults**

Restores all Meas Setup parameter values for the current measurement to their factory defaults.

**View Trace (Transmit Band Spurious)**

The measurement splits the transmit band into four segments (or less if the currently selected ARFCN is at the edge of the band). Two of these segments are on each side of the 3GPP Standard Specification transmit band. View/Trace allows you to view each segment in sequence after the
measurement completes (**Meas Type Full**), to automatically identify the worst performing segment (**Meas Type Examine**) or to manually select which segment to view (**Meas Type Examine**).

<table>
<thead>
<tr>
<th>Lower Segment</th>
<th>With <strong>Meas Type Examine</strong>, you can choose to examine the lower segment only.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lower Adj Segment</td>
<td>With <strong>Meas Type Examine</strong>, you can choose to examine the lower adjacent segment only.</td>
</tr>
<tr>
<td>Upper Adj Segment</td>
<td>With <strong>Meas Type Examine</strong>, you can choose to examine the upper adjacent segment only.</td>
</tr>
<tr>
<td>Upper Segment</td>
<td>With <strong>Meas Type Examine</strong>, you can choose to examine the upper segment only.</td>
</tr>
</tbody>
</table>

**Receive Band Spurious**

**Meas Setup (Receive Band Spurious)**

To access the keys for setting up a receive band spurious measurement, press MEASURE, Rx Band Spur, then follow the instructions on the Rx Band Spurious Setup screen before continuing to the front panel Meas Setup key.

---

**CAUTION**

Upon entering the Receive Band Spurious measurement, a setup screen appears cautioning you to avoid analyzer damage. The total carrier power applied to the analyzer MUST be < +20 dBm. Follow the instructions on the setup screen to avoid damaging the analyzer.

---

**Avg Number**

Toggles measurement averaging **On** or **Off**, and sets the number of measurement averages used to calculate the measurement result when **On** is selected. After the specified number of averages has been reached, the **Avg Mode** termination control setting determines the averaging action.

The defaults are **Off** and 10.

**Avg Mode**

Sets the termination control method used for the averaging function. The termination control methods are:

- **Exp**
  
  Exponential averaging. After the number of averages specified by **Avg Number** has been reached, each successive data acquisition is exponentially weighted and combined with the existing average.

- **Repeat**
  
  Repeat averaging. After the number of averages specified by **Avg Number** has been reached, the averaging is reset and a new average is started.
The default is **Exp**.

**Limit**

Sets the upper limit value for testing spurs. By default the parameter is based on the 3GPP Standard Specification. It changes depending on the **Band/Standard** and **Device** settings.

The default is –98 dBm with measurement set to factory defaults.

**Restore Meas Defaults**

Restores all **Meas Setup** parameter values for the current measurement to their factory defaults.

**Advanced**

Provides access to the following advanced measurement parameter settings:

**Res BW**

Sets the 3 dB resolution bandwidth in a 1, 3, 10 sequence.

The default is 100 kHz.

**Video BW**

Sets the analyzer post detection filter in a 1, 3, 10 sequence.

The default is 100 kHz.

**View Trace (Receive Band Spurious)**

**Spectrum**

Displays a spectrum trace view.

---

**Out of Band Spurious**

**Meas Setup (Out Of Band Spurious)**

To access the keys for setting up an out of band spurious measurement, press **MEASURE, Out Of Band Spurious**, and then the front panel **Meas Setup** key.

**Avg Number**

Toggles measurement averaging **On** or **Off**, and sets the number of measurement averages used to calculate the measurement result when **On** is selected. After the specified number of averages has been reached, the **Avg Mode** termination control setting determines the averaging action.

The defaults are **Off** and **10**.

**Avg Mode**

This key is always grayed out for this measurement and cannot be accessed. It shows that the averaging action taken after reaching the number of averages set with **Avg Number** is always **Exp** (exponential averaging—each successive data acquisition is exponentially weighted and combined with the existing average).

**Meas Type**

Sets the measurement to **Full Range** (the full frequency range of the
base station), or to **Intermod Bands** (only the relevant intermodulation frequency bands of the base station). The measurement uses the corresponding filter bandwidths and the sweep times appropriate to the BTS specifications.

The default is **Full Range**.

**MS Idle**

Sets the correct specification limits, depending on whether there is an active mobile station carrier or not. **MS Idle** is coupled to the **Limit** setting. This key is only available when **Device Type** is set to **MS** in the **Radio Mode** setup menu.

- **On**
  Use this setting when no active mobile station carrier is present to force the measurement to use the correct limits.

- **Off**
  Limits are set to the correct values when an active mobile station carrier is present.

  The default is **Off**.

**Inspect Spur**

Leads to the inspect spur menu once the measurement has finished running (all menu keys are grayed out while a measurement is running):

- **Inspect Spur**
  Sets **On** or **Off** the inspect spur functionality once the measurement has finished running. Also sets the inspect spur number for further examination.

  The defaults are **Off** and 0.

- **Sweep Time**
  Sets the sweep time used to inspect the spur.

  The default is 2.000 s.

- **Res BW**
  Sets the resolution bandwidth used to inspect the spur.

  The default is 1 MHz.

- **Video BW**
  Sets the video bandwidth used to inspect the spur.

  The default is 3 MHz.

**Limits....**

Leads to the limits form for changing limits values for the currently selected radio band and device. The measurement is restarted if any limits value is changed.

**Restore Meas Defaults**

Restores all **Meas Setup** parameter values for the current measurement to their factory defaults.

**Advanced**

Provides access to the following advanced measurement parameter setting:

- **Max Mxr Lvl**
  Sets the maximum power level at the RF mixer input for the measurement. The instrument uses this value to
automatically set the required attenuation to maintain the mixer input below the critical level.

The default is 5 dBm.

**View Trace (Out Of Band Spurious)**

**Spectrum**
Displays a spectrum trace view.

**Monitor Band/Channel**

**Meas Setup (Monitor Band/Channel)**
To access the keys for setting up a monitor band/channel measurement, press MEASURE, Monitor Band/Channel, and then the front panel Meas Setup key.

**Avg Number**
Toggles measurement averaging On or Off, and sets the number of measurement averages used to calculate the measurement result when On is selected. After the specified number of averages has been reached, the Avg Mode termination control setting determines the averaging action.

The defaults are Off and 10.

**Avg Mode**
Sets the termination control method used for the averaging function. The termination control methods are:

- **Exp**
  Exponential averaging. After the number of averages specified by Avg Number has been reached, each successive data acquisition is exponentially weighted and combined with the existing average.

- **Repeat**
  Repeat averaging. After the number of averages specified by Avg Number has been reached, the averaging is reset and a new average is started.

The default is Exp.

**Method**
Sets the monitoring method to Band or Channel.

The default is Band.

**Channel Span**
Toggles between monitoring One (the current ARFCN by itself) or Three (the ARFCN and its two adjacent channels). Channel Span is not available when Method is set to Band.

The default is One.

**Band**
Toggles between monitoring Tx (transmit) or Rx (receive). Band is not available when Method is set to Channel.
The default is **Tx**.

**Chan Setup**

Leads to the channel setup menu. **Chan Setup** is available only when **Method** is set to **Channel**. The channel setup parameters are:

- **Res BW**
  - Sets the 3 dB resolution bandwidth in a 1, 3, 10 sequence.
  - The default is 10 kHz.

- **Video BW**
  - Sets the analyzer post detection filter in a 1, 3, 10 sequence.
  - The default is 10 kHz.

- **Max Hold**
  - Toggles **On** or **Off** a trace of the maximum values for a measurement.
  - The default is **Off**.

- **Detector**
  - Sets the type of video detection used. Select from **Peak**, **Sample** and **Neg Peak** detection. **Detector** is not available when **Method** is set to **Band**.
  - The default is **Peak**.

**Band Setup**

Leads to the band setup menu. **Band Setup** is available only when **Method** is set to **Band**. The band setup parameters are:

- **Res BW**
  - Sets the 3 dB resolution bandwidth in a 1, 3, 10 sequence.
  - The default is 100 kHz.

- **Video BW**
  - Sets the analyzer post detection filter in a 1, 3, 10 sequence.
  - The default is 100 kHz.

- **Max Hold**
  - Toggles **On** or **Off** a trace of the maximum values for a measurement.
  - The default is **Off**.

- **Detector**
  - Sets the type of video detection used. Select from **Peak**, **Sample** and **Neg Peak** detection. **Detector** is not available when **Method** is set to **Band**.
  - The default is **Peak**.

**Restore Meas Defaults**

Restores all **Meas Setup** parameter values for the current measurement to their factory defaults.

**Display (Monitor Band/Channel)**

**Display Line**

Toggles **On** or **Off** an adjustable horizontal line that can be used as a visual reference line.
Key Reference
Measurement Keys

The default is Off.

**View Trace (Monitor Band/Channel)**

**Spectrum** Displays a spectrum trace view.

**EDGE Power Versus Time**

**Meas Setup (EDGE Power Versus Time)**

To access the keys for setting up an EDGE power versus time measurement, press MEASURE, EDGE Pwr vs Time, and then the front panel Meas Setup key.

**Avg Number** Toggles measurement averaging On or Off, and sets the number of measurement averages used to calculate the measurement result when On is selected. After the specified number of averages has been reached, the Avg Mode termination control setting determines the averaging action.

The defaults are Off and 10.

**Avg Mode** Sets the termination control method used for the averaging function. The termination control methods are:

- **Exp** 
  Exponential averaging. After the number of averages specified by Avg Number has been reached, each successive data acquisition is exponentially weighted and combined with the existing average.

- **Repeat** 
  Repeat averaging. After the number of averages specified by Avg Number has been reached, the averaging is reset and a new average is started.

The default is Exp.

**Average Type** Sets the type of averaging to be performed.

- **Video** 
  Sums the trace data and divides by the number of averages specified in Avg Number.

- **Power** 
  Converts the trace data from dB to power units, then averages the power trace data. This is more time consuming than Video averaging.

The default is Power.

**Meas Time** Sets the number of slots displayed. Up to 8 time slots can be displayed on the trace with each measurement cycle. This measurement is closely tied to sweep time.

The default is 1 slot.
**Trig Source**

Sets the trigger source for the EDGE power versus time measurement. Choose one of the following trigger sources:

- **Free Run (Immediate)**  This key is not available with this measurement.
- **External**  Activates the rear panel external trigger input. The external trigger must be a TTL signal.
- **RF Burst (Wideband)**  Activates an internal wideband RF burst trigger that has an automatic level control for burst signals. It triggers on a level that is relative to the peak of the RF burst. This setting is available only when hardware Option B7D and newer versions of Option B7E: RF Comms Hardware are installed. See the following note for details.
- **Frame**  Uses the internal frame clock to generate a trigger signal. The clock parameters are controlled under the **Mode Setup** key or the measurement firmware, but not both. This setting is available only when hardware Options B7D and B7E are installed.

The default is RF Burst (Wideband) when hardware Option B7D and newer versions of Option B7E: RF Comms Hardware are installed, otherwise the default is **External**. See the following note for details.

---

**NOTE**

Option B7E: RF Comms Hardware has at least three possible part numbers. Press System, More, Show Hdwr to show your instrument's RF Comms Hardware and view the part number. If the part number is E4401-60087 (the original version), the RF Burst trigger source will not be available with this measurement, and the default will be **External**.

---

**Burst Sync**

Sets the synchronization of the measurement to the correct part of the burst. Choose one of the following synchronization methods:

- **Training Seq**  Synchronizes the measurement to the timing of the demodulated training sequence of the burst. This is the most precise method, but requires a burst with a valid TSC (Training Sequence Code). This key is grayed out and not available if hardware Options B7D and B7E are not installed.
- **RF Amptd**  Synchronizes the measurement to the burst transition of the measured RF carrier.
- **None**  Uses the start of the time record as the start of the useful part of the burst.

The default is **Training Seq** when hardware Options B7D and B7E are installed, otherwise the default is **RF Amptd**.

---

**Pwr Ctrl Lvl**

Sets the output power of the transmitter when testing MS devices. The appropriate power level for measuring the device under test will
correspond with the transmitter power control level setting. **Pwr Ctrl Lvl** does not affect BTS limit masks.

The default is 0.

**Max Hold**

Toggles trace maximum hold **On** or **Off** while the **Monitor** view is enabled. With any other view, **Max Hold** is not available and set to **Off**. The last state is restored if you exit to another view and then return to **Monitor** view.

The default is **Off**.

**Limit Test**

Toggles active limit checking **On** or **Off**—this does not turn on or off the limit lines which are accessed through the **Display** front panel key menu.

The default is **On**.

**Restore Meas Defaults**

Restores all **Meas Setup** parameter values for the current measurement to their factory defaults.

**Advanced**

Provides access to the following advanced measurement parameter settings:

- **Res BW**
  
  Sets the 3 dB resolution bandwidth settings in a 1, 3, 10 sequence.
  
  The default is 300 kHz.

---

**NOTE**

To achieve an adequately low noise floor for the EDGE measurement, the ESA uses the 300 kHz RBW filter as default. Since this RBW is narrower than an EDGE signal, the carrier power will be under measured by 0.29 dB, and as such the reference point for positioning the mask in the Y axis will be offset by the same amount. Therefore, to ensure optimum positioning of the mask when a 300 kHz RBW is selected, the measurement will automatically correct the mask position by 0.29 dB. Note that this correction can be reversed by setting the mask offset to -0.29 dB.

- **Video BW**
  
  Sets the analyzer post detection filter in a 1, 3, 10 sequence.
  
  The default is 300 kHz.

- **Mask Ref Pwr**
  
  Sets the calculation of the mask reference power to either the **TSC Symbols** method or the **Demodulation** method.
  
  The default is **TSC Symbols**.

- **Mask Offset**
  
  Sets the amplitude offset of the limit mask to apply when calculating the relative portions of power versus time.
The default is 0.00 dB.

**Trace Points**  Leads to a menu listing the available trace point samples that can be selected for the measurement:

- **401 samples**  Provides fastest measurement times, with lowest resolution.
- **801 samples**  Provides faster measurement times with less resolution.
- **1601 samples**  Optimizes measurement time and accuracy.
- **3201 samples**  Recommended setting for the *Rise & Fall* view.
- **6401 samples**  Provides highest accuracy with slowest measurement times.

The default is 1601 samples.

**Sweep Time**  Shows the sweep time used for the current *Meas Time* parameter setting. This information can be used with the *Trace Points* setting to help calculate the burst mask alignment uncertainty. The key is available only for viewing sweep time.

The default is 720 µs.

**Display (EDGE Power versus Time)**

**Limit Display**  Toggles the limit mask display *On* or *Off*. This does not affect any calculations that are taking place.

The default is *On*.

**Current Data**  The values for Mean Transmit Power, Max Pt, and Min Pt for the current trace are calculated and displayed on the results screen by default. *Current Data* to toggles the calculation and display of these values *On* or *Off*. The measurement executes faster when the parameter is set to *Off*.

The default is *On*.

**View Trace (EDGE Power versus Time)**

**Mask**  Select *Mask* view to analyze a complete burst and compare it to the set of upper and lower limit lines specified by the 3GPP Standards, or to custom sets of upper and lower limit lines that can be constructed using SCPI commands (refer to *Chapter 4*, “Programming Commands,” for more information). *Max Hold* and *Full Screen* are not available with this view.
Key Reference
Measurement Keys

Monitor
Select Monitor to view up to 8 time slots (an entire frame). Limit Display lines are not available in this view.

Rise & Fall
Select Rise & Fall view to zoom in on the rising and falling portions of the current time slot. Markers, Max Hold, and Full Screen are not available with this view.

‘On’ Burst
Select ‘On’ Burst to view the portion of the burst which lies between the rising and falling edges. Markers, Max Hold, and Full Screen are not available with this view.

The default is Mask.

EDGE EVM

Meas Setup (EDGE EVM)
To access the keys for setting up an EDGE EVM measurement, press MEASURE, EDGE EVM, and then the front panel Meas Setup key.

Avg Number
Toggles measurement averaging On or Off, and sets the number of measurement averages used to calculate the measurement result when On is selected. After the specified number of averages has been reached, the Avg Mode termination control setting determines the averaging action.

The defaults are Off and 10.

Avg Mode
Sets the termination control method used for the averaging function. The termination control methods are:

Exp
Exponential averaging. After the number of averages specified by Avg Number has been reached, each successive data acquisition is exponentially weighted and combined with the existing average.

Repeat
Repeat averaging. After the number of averages specified by Avg Number has been reached, the averaging is reset and a new average is started.

The default is Repeat.

Trig Source
Sets the trigger source for the EDGE EVM measurement. Choose one of the following trigger sources:

Free Run (Immediate) Trigger occurs at the time the data is requested, completely asynchronous to the RF or IF signal.

RF Burst (Wideband) Activates an internal wideband RF burst trigger that has an automatic level control for burst signals. It triggers on a level that is relative to the peak of the RF
burst. If the data sent is all 0 bits, this trigger will give erratic or falsely high EVM results. This setting is available only when hardware Option B7D and newer versions of Option B7E: RF Comms Hardware are installed. See the following note for details.

**External**
Activates the rear panel external trigger input. The external trigger must be a TTL signal.

**Frame**
Uses the internal frame clock to generate a trigger signal. The clock parameters are controlled under the Mode Setup key or the measurement firmware, but not both. This setting is available only when hardware Options B7D and B7E are installed.

The default is RF Burst (Wideband) when hardware Option B7D and newer versions of Option B7E: RF Comms Hardware are installed, otherwise the default is External. See the following note for details.

**NOTE**
Option B7E: RF Comms Hardware has at least three possible part numbers. Press System, More, Show Hdw to show your instrument’s RF Comms Hardware and view the part number. If the part number is E4401-60087 (the original version), the RF Burst trigger source will not be available with this measurement, and the default will be External.

**Burst Sync**
The EDGE EVM measurement only supports measurements of standard compliant EDGE normal bursted signals containing a valid Training Sequence Code. Burst Sync is not available for any other settings, and is always set to Training Seq (Training Sequence).

**Droop Comp**
Sets the droop compensation algorithm to On or Off.
The default is On.

**Rotation**
Sets apply rotation to the I/Q Constellation diagram On or Off.
The default is On.

**Limit Test**
Toggles active limit checking On or Off—this does not turn on or off the limit lines, which are accessed through the Display front panel key menu.
The default is On.

**Limits...**
Leads to a screen with the following EVM phase and frequency settings:

**RMS EVM Limit**
The RMS phase error must be less than or equal to this limit.
The default is 7 % when Device is BTS, and 9 % when Device is MS.

**Peak EVM Limit**
The peak phase error must be less than or equal to this...
limit.

The default is 22 % when Device is BTS, and 30 % when Device is MS.

**95th Percentile EVM Limit** The 95th percentile EVM must be less than or equal to this limit.

The default is 11 % when Device is BTS, and 15 % when Device is MS.

**I/Q Origin Offset Suppression Limit** The I/Q origin offset must be greater than this limit.

The default is −35.0 dBC when Device is BTS, and −30.0 dBC when Device is MS.

**Frequency Offset Limit** The frequency offset error must be less than or equal to this limit.

The default setting is:

- 0.05 ppm when Device is BTS or uBTS
- 0.1 ppm when Device is pBTS
- 0.1 ppm when Device is MS (except for Band/Standard GSM 450 or GSM 480)
- 0.2 ppm when Device is MS and Band/Standard is GSM 450 or GSM 480

<table>
<thead>
<tr>
<th><strong>Restore Meas Defaults</strong></th>
<th>Restores all Meas Setup parameter values for the current measurement to their factory defaults.</th>
</tr>
</thead>
</table>

**Display (EDGE EVM)**

**Symbol Dots (Polar Vector)** Sets the display of the measured values used to calculate the polar vector view On or Off. If turned On, these values (coordinates) are superimposed on the polar vector view.

The default is On.

**Symbol Dots (Quad View)** Sets the display of the measured values used to calculate the quad view On or Off. If turned On, these values (coordinates) are superimposed on the quad graph view.

The default is On.

**View Trace (EDGE EVM)**

**I/Q Measured Polar Vector** Sets the display to I/Q Measured Polar Vector view.
I/Q Measured Polar ConstIn
Sets the display to I/Q Measured Polar Constellation view.

I/Q Error (Quad View)
Sets the display to I/Q Error Quad view.

**EDGE Output RF Spectrum**

**Meas Setup (EDGE Output RF Spectrum)**
To access the keys for setting up an EDGE Output RF Spectrum (ORFS) measurement, press **MEASURE, EDGE Output RF Spectrum**, and then the front panel **Meas Setup** key.

**Avg Number**
Toggles measurement averaging On or Off, and sets the number of measurement averages used to calculate the measurement result when On is selected. After the specified number of averages has been reached, the Avg Mode termination control setting determines the averaging action.

The defaults are Off and 10.

**Avg Mode**
Sets the termination control method used for the averaging function. The key is not available and set to Repeat when the Multi-Offset measurement method is selected. The termination control methods are:

- **Exp**
  Exponential averaging. After the number of averages specified by Avg Number has been reached, each successive data acquisition is exponentially weighted and combined with the existing average.

- **Repeat**
  Repeat averaging. After the number of averages specified by Avg Number has been reached, the averaging is reset and a new average is started.

The default is Repeat.

**Meas Method**
Leads to a menu with the following measurement method selections:

- **Multi-Offset**
  Automatically makes measurements at all offset frequencies listed in the Standard or Short frequency list. (See Table 3-2, “Offset Frequency Lists.”)

- **Single Offset (Examine)**
  Makes a measurement at a single offset frequency as set by the Offset Freq softkey.

- **Swept**
  Sets the trigger source to Free Run, and disables the Trigger Source softkey when selected. The Trigger Source state is restored when the measurement mode is returned to Single Offset or Multi-Offset.

The default is Multi-Offset.
**Key Reference**

**Measurement Keys**

**Meas Type**
Toggles the measurement type between **Mod** (EDGE ORFS due to modulation), and **Switch** (EDGE ORFS due to switching transients or burst ramping).

The default is **Mod**.

**Ofs Freq List**
Set to **Std** (standard) or **Short** to define which frequency offsets to scan. See Table 3-2, “Offset Frequency Lists.” **Ofs Freq List** is not available when **Meas Method** is set to **Single Offset** or **Swept**.

The default is **Short**.

**Offset Freq**
Sets a frequency offset from the carrier at which to perform a single offset EDGE Output RF Spectrum measurement. **Offset Freq** is not available when **Meas Method** is set to **Multi-Offset** or **Swept**.

The default is 250 kHz.

**Trig Source**
Sets the trigger source for the EDGE ORFS measurement. The **Trig Source** key is grayed out and set to **External** when the **Swept** measurement method is selected. The previous **Trigger Source** state is returned when the measurement method is returned to **Single Offset** or **Multi-Offset**. Choose one of the following trigger sources:

- **Free Run (Immediate)** Allows trigger to occur at the time the data is requested, completely asynchronous to the RF or IF signal. This key is not available if **Single Offset** or **Multi-Offset** measurement method is selected.

- **RF Burst (Wideband)** Activates an internal wideband RF burst trigger that has an automatic level control for burst signals. It triggers on a level that is relative to the peak of the RF burst. This setting is available only when hardware Option B7D and newer versions of Option B7E: RF Comms Hardware are installed. See the following note for details.

- **External** Activates the rear panel external trigger input. The external trigger must be a TTL signal.

- **Frame** Uses the internal frame clock to generate a trigger signal. The clock parameters are controlled under the **Mode Setup** key or the measurement firmware, but not both. This setting is available only when hardware Options B7D and B7E are installed.

The default is **RF Burst (Wideband)** when hardware Option B7D and newer versions of Option B7E: RF Comms Hardware are installed, otherwise the default is **External**. See the following note for details.

**NOTE**
Option B7E: RF Comms Hardware has at least three possible part numbers. Press **System, More, Show Hdwr** to show your instrument’s RF Comms Hardware and view the part number. If the part number is
E4401-60087 (the original version), the RF Burst trigger source will not be available with this measurement, and the default will be External.

**Burst Sync**
Sets the synchronization of the measurement to the correct part of the burst. Choose one of the following synchronization methods:

- **Training Seq**
  Synchronizes the measurement to the timing of the demodulated training sequence of the burst. This is the most precise method, but requires a burst with a valid TSC (Training Sequence Code). This key is not available if hardware Options B7D and B7E are not installed.

- **RF Amptd**
  Synchronizes the measurement to the burst transition of the measured RF carrier.

- **None**
  Uses the start of the time record as the start of the useful part of the burst.

The default is Training Seq when hardware Options B7D and B7E are installed, otherwise the default is RF Amptd.

**Widebnd Noise**
Sets the frequency range that is swept on either side of the carrier center frequency. Available only when Meas Type is set to Mod and measurement method is Swept.

- **On**
  The analyzer tunes to the carrier, and the whole relevant band plus 2 MHz either side of center frequency is swept.

- **Off**
  The analyzer tunes to the carrier, and 1800 kHz below and above either side of the center frequency is swept.

The default is Off.

**Restore Meas Defaults**
Restores all Meas Setup parameter values for the current measurement to their factory defaults.

**Advanced**
Provides access to the following advanced measurement parameter settings:

- **Ref Pwr Avg**
  Sets the number of averages to be taken when determining the reference power (at 0 Hz offset). Available only when Meas Method is set to Single Offset.

  - **Auto**
    Uses the number of averages equal to that specified in the Avg Number parameter.

  - **Manual**
    Lets you manually specify the number of averages.

The defaults are Auto and 10.
Key Reference

Measurement Keys

Max Mxr Lvl  Sets the maximum power at the RF mixer input. The instrument will automatically set the optimum attenuation value based on the value entered.

The default is $-4.00$ dBm.

Mod BWs  Leads to a menu with custom RBW settings that deviate from the GSM standard for EDGE ORFS due to modulation:

- $<1800$ kHz Offset RBW  Sets the RBW for measuring offsets of less than 1800 kHz.
  The default is 30 kHz.

- $\geq1800$ kHz Offset RBW  Sets the RBW for measuring offsets greater than or equal to 1800 kHz.
  The default is 100 kHz.

Switch BWs  Leads to a menu with custom RBW settings that deviate from the GSM standard for EDGE ORFS due to switching:

- $<1800$ kHz Offset RBW  Sets the RBW for measuring offsets of less than 1800 kHz.
  The default is 30 kHz.

- $\geq1800$ kHz Offset RBW  Sets the RBW for measuring offsets greater than or equal to 1800 kHz.
  The default is 30 kHz.

- $<1800$ kHz VBW  Sets the video BW for measuring offsets of less than 1800 kHz.
  The default is 100 kHz.

- $\geq1800$ kHz VBW  Sets the video BW for measuring offsets greater than or equal to 1800 kHz.
  The default is 100 kHz.

Display (EDGE Output RF Spectrum)

Table Display  When the measurement method is set to Multi-Offset, the results table can be changed to show any of the following sets of values:

- Rslt  Displays the actual measurement results.

- Lim  Displays the absolute and relative limits for all offsets.

- Mrgn  Displays the margin by which the result meets
specifications. Negative numbers indicate that the result has failed.

The default setting is RsIt.

**View Trace (EDGE Output RF Spectrum)**

| Numeric Results | Shows measurement results with a numeric data view. Numeric Results are not available unless Meas Method = Multi-Offset. |
Key Reference

Measurement Keys
These commands are only available when the GSM (w/EDGE) mode has been selected using INStrument:SELect. Once a mode is selected, commands that are unique to another mode are not available.
The following table lists the SCPI subsystems or subsections associated with the instrument GSM, EDGE function categories. The commands listed are for GSM, EDGE specific functions. If you require information on the commands for the Agilent ESA Spectrum Analyzers, refer to the ESA Spectrum Analyzers User's/Programmer's Reference.

CALCulate Subsystem

This subsystem is used to perform post-acquisition data processing. In effect, the collection of new data triggers the CALCulate subsystem. In this instrument, the primary functions in this subsystem are markers and limits.

The SCPI default for data output format is ASCII. The format can be changed to binary with FORMat:DATA which transports faster over the bus.

Test Current Results Against all Limits

:CALCulate:CLIMits:FAIL?

Queries the status of the current measurement limit testing. It returns a 0 if the measured results pass when compared with the current limits. It returns a 1 if the measured results fail any limit tests.
EDGE Error Vector Magnitude (EEVM) - Limits

EDGE RMS EVM Limit

:CALCulate:EEVM:LIMit:BS|BTS|MS:REVM[:UPPer][:DATA]<percent>

:CALCulate:EEVM:LIMit:BS|BTS|MS:REVM[:UPPer][:DATA]?

Set or query the device RMS EVM limit.

Factory Preset:  7.00 % for BTS\BS device
  9.00 % for MS device

Range:  0 to 100 %

Default Unit:  percent

Remarks:  You must be in GSM, EDGE mode to use this command.
Use INSTrument:SELect to set the mode.

EDGE Peak EVM Limit

:CALCulate:EEVM:LIMit:BS|BTS|MS:PEVM[:UPPer][:DATA]<percent>

:CALCulate:EEVM:LIMit:BS|BTS|MS:PEVM[:UPPer][:DATA]?

Set or query the device peak EVM limit.

Factory Preset:  22.00 % for BTS\BS device
  30.00 % for MS device

Range:  0 to 100 %

Default Unit:  percent

Remarks:  You must be in GSM, EDGE mode to use this command.
Use INSTrument:SELect to set the mode.
EDGE 95th Percentile EVM Limit

:CALCulate:EEVM:LIMIT:BS|BTS|MS:EVMP95[:UPPer][:DATA]<percent>

:CALCulate:EEVM:LIMIT:BS|BTS|MS:EVMP95[:UPPer][:DATA]?  
Set or query the device 95th percentile EVM limit.

Factory Preset: 11.00 % for BTS|BS device
15.00 % for MS device

Range: 0 to 100 %

Default Unit: percent

Remarks: You must be in GSM, EDGE mode to use this command. Use INStRument:SELect to set the mode.

EDGE I/Q Origin Offset Suppression Limit

:CALCulate:EEVM:LIMIT:BS|BTS|MS:IQ0Offset[:UPPer][:DATA]<rel_ampl>

:CALCulate:EEVM:LIMIT:BS|BTS|MS:IQ0Offset[:UPPer][:DATA]?
Set or query the device I/Q origin offset suppression limit.

Factory Preset: −35 dB for BTS|BS device
−30 dB for MS device

Range: −200 to 200 dB

Default Unit: dB

Remarks: You must be in GSM, EDGE mode to use this command. Use INStRument:SELect to set the mode.

EDGE EVM Frequency Error Limits—BTS

:CALCulate:EEVM:LIMIT:<standard>:BS|BTS:FERRor:UPPer[:DATA]<real number>

:CALCulate:EEVM:LIMIT:<standard>:BTS:FERRor:UPPer[:DATA]?
Set or query any of the BTS related frequency error limits for the EDGE EVM measurement. Replace <standard> in the above command strings with the appropriate keyword or abbreviated keyword from the table.
below.

Table 4-1  Valid GSM Standards Used in the SCPI Command

EDGE Output RF Spectrum (EORFS) - Limits

EDGE ORFS Due To Modulation Absolute Limits Commands

Use the commands in this section to change the EDGE Output RF Spectrum absolute limits to your own custom limits values.

ORFS limits are generally specified in dB relative to the reference power (ref power). This equates to the absolute power which the result must not exceed. Standards documents also supply an absolute power level—below which the calculated relative limit (ref power – relative limit) will not be applied—for each ORFS type, radio standard, device type and offset frequency.

Therefore the relative limit applies if the calculated limit (ref power – relative limit) is greater than the absolute limit. Otherwise the absolute limit applies.

Example:
If relative limit = $-75$ dB and absolute limit = $-65$ dBm.

Table 4-5

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1. If the ref power is measured at 43 dBm, then:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Upper result limit due to relative limit = $43 - 75 = -32$ dBm</td>
</tr>
<tr>
<td></td>
<td>Upper result limit due to absolute limit = $-65$ dBm</td>
</tr>
<tr>
<td></td>
<td>A relative limit of $-32$ dBm therefore applies.</td>
</tr>
<tr>
<td>2. If the ref power is measured at 0 dBm, then:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Upper result limit due to relative limit = $0 - 75 = -75$ dBm</td>
</tr>
<tr>
<td></td>
<td>Upper result limit due to absolute limit = $-65$ dBm</td>
</tr>
<tr>
<td></td>
<td>An absolute limit of $-65$ dBm therefore applies.</td>
</tr>
</tbody>
</table>

The commands are presented according to the following devices: MS, BTS, UBTS1, UBTS2, UBTS3 and PBTS1.

EDGE ORFS Due To Modulation Absolute Limits—BTS

:ABSolute[:UPPer]:DATA[n] <amplitude>

:ABSolute[:UPPer]:DATA[n]?

Set or query any of the absolute BTS related limits for the EDGE ORFS due to modulation measurement. Replace <standard> in the above
command strings with the appropriate keyword or abbreviated keyword from the table below.

Table 4-6  Valid GSM Standards Used in the SCPI Command

EDGE ORFS Due To Modulation Relative Limits Commands

Use the commands in this section to change the EDGE Output RF Spectrum relative limits to your own custom limits values.

ORFS limits are generally specified in dB relative to the reference power (ref power). This equates to the absolute power which the result must not exceed. Standards documents also supply an absolute power level—below which the calculated relative limit (ref power – relative limit) will not be applied—for each ORFS type, radio standard, device type and offset frequency.

Therefore the relative limit applies if the calculated limit (ref power – relative limit) is greater than the absolute limit. Otherwise the absolute limit applies.

Example:

If relative limit = –75 dB and absolute limit = –65 dBm.

Table 4-18

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>If the ref power is measured at 43 dBm, then:</td>
</tr>
<tr>
<td></td>
<td>Upper result limit due to relative limit = 43 – 75 = –32 dBm</td>
</tr>
<tr>
<td></td>
<td>Upper result limit due to absolute limit = –65 dBm</td>
</tr>
<tr>
<td></td>
<td>A relative limit of –32 dBm therefore applies.</td>
</tr>
</tbody>
</table>

| 2. | If the ref power is measured at 0 dBm, then: |
|   | Upper result limit due to relative limit = 0 – 75 = –75 dBm |
|   | Upper result limit due to absolute limit = –65 dBm |
|   | An absolute limit of –65 dBm therefore applies. |

The commands are presented according to standards DCS 1800, GSM 900 and PCS 1900 for devices MS, BTS and UBTS.

EDGE ORFS Due To Modulation DCS Relative Limits—BTS

Set or query any of the DCS 1800 BTS relative limits for the EDGE ORFS due to modulation measurement. Replace <Pnn> in the above command strings with the appropriate BS TX Level.

Table 4-19 below shows how each <Pnn> is associated with a value that
must be referenced using a numeric from 1 to 9. Replace nn in the above command strings with the appropriate numeric to set or query the desired relative limit for the required offset frequency. For further information, refer to the example provided in this section (page 155) for the EDGE ORFS Due To Modulation DCS Relative Limits—MS command.

NOTE
The relative limit applied depends on the measured total carrier power. If the measured total carrier power lies between these discrete power values noted in the table the limit value is linearly interpolated.

Factory Preset: Refer to Table 4-19.
Range: $-150 \text{ dB to } 150 \text{ dB}$
Default Unit: dB
Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

| Front Panel Access: None |

EDGE ORFS Due To Modulation DCS Relative Limits—MS

 [:UPPer]:DATA [n] <amplitude>

[:UPPer]:DATA[n]?

Set or query any of the DCS 1800 MS relative limits for the EDGE ORFS due to modulation measurement. Replace <Pnn> in the above command strings with the appropriate MS TX Level.

Table 4-20 below shows how each <Pnn> is associated with a value that must be referenced using a numeric from 1 to 9. Replace nn in the above command strings with the appropriate numeric to set or query the desired relative limit for the required offset frequency.

NOTE

The relative limit applied depends on the measured total carrier power. If the measured total carrier power lies between these discrete power values noted in the table the limit value is linearly interpolated.

Example:

The following command sets the relative result limit to −65.0 dB (the default value is −60.0 dB) when testing a DCS MS device at 400 kHz offset and total carrier power = 34 dBm:

:CALCulate:EORFspectr:MODulation:LIMit:DCS|DCS1800:MS
  :P34:UPPer:DATA5 −65.0

Factory Preset: Refer to Table 4-20.

Range: −150 dB to 150 dB

Default Unit: dB

Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

Front Panel Access: None

</table>
EDGE ORFS Due To Modulation DCS Relative Limits—PBTS

Set or query any of the DCS 1800 PBTS relative limits for the EDGE ORFS due to modulation measurement. Replace <Pnn> in the above command strings with the appropriate BS TX Level.

Table 4-21 below shows how each <Pnn> is associated with a value that must be referenced using a numeric from 1 to 9. Replace nn in the above command strings with the appropriate numeric to set or query the desired relative limit for the required offset frequency. For further information, refer to the example provided in this section (page 155) for the EDGE ORFS Due To Modulation DCS Relative Limits—MS command.

NOTE
The relative limit applied depends on the measured total carrier power. If the measured total carrier power lies between these discrete power values noted in the table the limit value is linearly interpolated.

Factory Preset: Refer to Table 4-21.

Range: −150 dB to 150 dB

Default Unit: dB

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SElec to set the mode.

Front Panel Access: None

EDGE ORFS Due To Switching Transients Absolute Limits Commands—BTS, PBTS, and UBTS

Use the commands in this section to change the EDGE output RF spectrum due to switching transients absolute limits to your own custom limits values.

ORFS limits are generally specified in dB relative to the reference power (ref power). This equates to the absolute power which the result must not exceed. Standards documents also supply an absolute power level—below which the calculated relative limit (ref power − relative limit) will not be applied—for each ORFS type, radio standard, device type and offset frequency.

Therefore the relative limit applies if the calculated limit (ref power − relative limit) is greater than the absolute limit. Otherwise the absolute limit applies.

Example:

If relative limit = −75 dB and absolute limit = −65 dBm.

Table 4-31

<table>
<thead>
<tr>
<th></th>
<th>If the ref power is measured at 43 dBm, then:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Upper result limit due to relative limit = 43 − 75 = −32 dBm</td>
</tr>
<tr>
<td></td>
<td>Upper result limit due to absolute limit = −65 dBm</td>
</tr>
<tr>
<td></td>
<td>A relative limit of −32 dBm therefore applies.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th></th>
<th>If the ref power is measured at 0 dBm, then:</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Upper result limit due to relative limit = 0 − 75 = −75 dBm</td>
</tr>
<tr>
<td></td>
<td>Upper result limit due to absolute limit = −65 dBm</td>
</tr>
<tr>
<td></td>
<td>An absolute limit of −65 dBm therefore applies.</td>
</tr>
</tbody>
</table>

Note that for ORFS due to switching transients the above only applies to BTS, UBTS and PBTS devices as MS limits are specified in absolute terms (dBm) only.

The commands are presented according to devices BTS, UBTS1, UBTS2, UBTS3 and PBTS1.
Programming Commands
CALCulate Subsystem

EDGE ORFS Due To Switching Transients Absolute Limits—BTS

:CALCulate:EORFspectr:SWITching:LIMit:<standard>:BTS:ABSolute[:UPPer]:DATA[n]?

Set or query any of the absolute BTS related limits for the EDGE ORFS due to switching transients measurement. Replace <standard> in the above command strings with GSM, GSM900, DCS, DCS1800, PCS or PCS1900.

Table 4-32 shows how each <standard> is associated with a value that must be referenced using numeric 1 or 2. Replace n in the above command strings with the appropriate numeric to set or query the desired limit.

Example:

The following command sets the absolute result limit to −40 dBm when testing an E-GSM BTS device for offsets ≥ 1800 kHz (the default value is -36.0 dBm):

Factory Preset: Refer to Table 4-32.

Range: −150 dBm to 150 dBm
Default Unit: dBm
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel Access: None

<table>
<thead>
<tr>
<th>Offset</th>
<th>GSM/GSM900</th>
<th>DCS/DCS1800</th>

</tr>
<tr>
<td>≥ 1800 kHz (n=2)</td>
<td>−36.0</td>
<td>−36.0</td>
<td>−36.0</td>
</tr>
</tbody>
</table>
EDGE ORFS Due To Switching Transients Absolute Limits—PBTS1

:CALCulate:EORFspectr:SWITching:LIMit:<standard>:PBTS1:ABSolute[:UPPer]:DATA[n]?

Set or query any of the absolute PBTS1 related limits for the EDGE ORFS due to switching transients measurement. Replace <standard> in the above command strings with GSM, GSM900, DCS, DCS1800, PCS or PCS1900.

Table 4-33 shows how each <standard> is associated with a value that must be referenced using numeric 1 or 2. Replace n in the above command strings with 1 to set or query the desired limit. For further information, refer to the example provided in this section (page 171) for the EDGE ORFS Due To Switching Transients Absolute Limits—BTS command.

Factory Preset: Refer to Table 4-33.

Range: −150 dBm to 150 dBm

Default Unit: dBm

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel Access: None

EDGE ORFS Due To Switching Transients Absolute Limits—UBTS1

:CALCulate:EORFspectr:SWITching:LIMit:<standard>:UBTS1: ABSolute[:UPPer]:DATA[n]?

Set or query any of the absolute UBTS1 related limits for the EDGE ORFS due to switching transients measurement. Replace <standard> in the above command strings with GSM, GSM900, DCS, DCS1800, PCS or PCS1900.

Table 4-34 shows how each <standard> is associated with a value that must be referenced using numeric 1 or 2. Replace n in the above command strings with 1 to set or query the desired limit. For further information, refer to the example provided in this section (page 171) for the EDGE ORFS Due To Switching Transients Absolute Limits—BTS command.

Factory Preset: Refer to Table 4-34.

Range: −150 dBm to 150 dBm

Default Unit: dBm

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

EDGE ORFS Due To Switching Transients Absolute Limits—UBTS2

:CALCulate:EORFspectr:SWITching:LIMit:<standard>:UBTS2:ABSolute[:UPPer]:DATA[n]?

Set or query any of the absolute UBTS2 related limits for the EDGE ORFS due to switching transients measurement. Replace <standard> in the above command strings with GSM, GSM900, DCS, DCS1800, PCS or PCS1900.

Table 4-35 shows how each <standard> is associated with a value that must be referenced using numeric 1 or 2. Replace n in the above command strings with 1 to set or query the desired limit. For further information, refer to the example provided in this section (page 171) for the EDGE ORFS Due To Switching Transients Absolute Limits—BTS command.

Factory Preset: Refer to Table 4-35.

Range: −150 dBm to 150 dBm

Default Unit: dBm

Remarks: You must be in GSM, EDGE mode to use this command. Use INstrumENt:SELeCt to set the mode.

EDGE ORFS Due To Switching Transients Relative Limits
Commands—BTS, PBTS and UBTS

Use the commands in this section to change the EDGE output RF spectrum due to switching transients relative limits to your own custom limits values.

ORFS limits are generally specified in dB relative to the reference power (ref power). This equates to the absolute power which the result must not exceed. Standards documents also supply an absolute power level—below which the calculated relative limit (ref power – relative limit) will not be applied—for each ORFS type, radio standard, device type and offset frequency.

Therefore the relative limit applies if the calculated limit (ref power – relative limit) is greater than the absolute limit. Otherwise the absolute limit applies.

Example:
If relative limit = −75 dB and absolute limit = −65 dBm.

Table 4-37

<table>
<thead>
<tr>
<th></th>
<th>If the ref power is measured at 43 dBm, then:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Upper result limit due to relative limit = 43 − 75 = −32 dBm</td>
</tr>
<tr>
<td></td>
<td>Upper result limit due to absolute limit = −65 dBm</td>
</tr>
<tr>
<td></td>
<td>A relative limit of −32 dBm therefore applies.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th></th>
<th>If the ref power is measured at 0 dBm, then:</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Upper result limit due to relative limit = 0 − 75 = −75 dBm</td>
</tr>
<tr>
<td></td>
<td>Upper result limit due to absolute limit = −65 dBm</td>
</tr>
<tr>
<td></td>
<td>An absolute limit of −65 dBm therefore applies.</td>
</tr>
</tbody>
</table>

Note that for ORFS due to switching transients the above only applies to BTS, PBTS and UBTS devices as MS limits are specified in absolute terms (dBm) only.

EDGE ORFS Due To Switching Transients Relative Limits—DCS

:CALCulate:EORFspectr:SWITching:LIMit:DCS|DCS1800
:BTS|PBTS|UBTS[:UPPer]:DATA[n] <amplitude>

:CALCulate:EORFspectr:SWITching:LIMit:DCS|DCS1800
:BTS|PBTS|UBTS[:UPPer]:DATA[n]?
Set or query any of the relative DCS related limits for the EDGE ORFS due to switching transients measurement.

Table 4-38 shows how each <device> is associated with a value that must be referenced using a numeric from 1 to 5. Replace n in the above command strings with the appropriate numeric to set or query the desired relative limit for the required offset frequency. Note that entries in the Power column (n=1) are currently not used. For further information, refer to the example provided in this section (page 177) for the EDGE ORFS Due To Switching Transients Relative Limits—GSM command.

Factory Preset: Refer to Table 4-38.

Range: −150 dB to 150 dB

Default Unit: dB

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel Access: None

EDGE ORFS Due To Switching Transients Relative Limits—GSM

:CALCulate:EORFspectr:SWITching:LIMit:GSM|GSM900
:BTS|PBTS|UBTS[:UPPer]:DATA[n] <amplitude>

:CALCulate:EORFspectr:SWITching:LIMit:GSM|GSM900
:BTS|PBTS|UBTS[:UPPer]:DATA[n]?

Set or query any of the relative GSM related limits for the EDGE ORFS due to switching transients measurement.

Table 4-39 shows how each <device> is associated with a value that must be referenced using a numeric from 1 to 5. Replace n in the above
command strings with the appropriate numeric to set or query the desired relative limit for the required offset frequency. Note that entries in the Power column (n=1) are currently not used.

Example:
The following command sets the relative result limit to $-70$ dB (the default value is $-74.0$ dB) when testing a GSM BTS device at 1200 kHz offset:

```plaintext
:CALCulate:EORFspectr:SWITching:LIMit:GSM:BTS:UPPer :DATA4  -70.0
```

Factory Preset: Refer to Table 4-39.

Range: $-150$ dB to $150$ dB

Default Unit: dB

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELect to set the mode.

Front Panel Access: None

EDGE ORFS Due To Switching Transients Absolute Limits Commands—MS

Use the commands in this section to change the EDGE output RF spectrum due to switching transients limits for MS devices, to your own custom limits values. The output RF spectrum due to switching transients test for MS devices, uses limits that are specified in absolute units—that is, dBm.

Note that the limit applied—as shown in the table that accompanies each command—depends on the total carrier power. If the measured carrier power lies between these discrete power values, the limit value is linearly interpolated. If it lies above or below the range specified, the upper or lower limit set are used respectively.

EDGE ORFS Due To Switching Transients DCS MS Limits

:CALCulate:EORFspectr:SWITching:LIMit:DCS|DCS1800:MS:<Pnn> [:ABSolute][:UPPer]:DATA[n]?

Set or query any of the DCS MS absolute limit related commands for the EDGE ORFS due to switching transients measurement. Replace <Pnn> in the above command strings with the appropriate MS TX Level. The measured total carrier power will determine which row of limits will be applied.

Table 4-41 shows how each <Pnn> is associated with a value that must be referenced using a numeric from 1 to 5. Replace nn in the above command strings with the appropriate numeric to set or query the desired relative limit for the required offset frequency. You can also change the values in the Power column (n=1) to alter the carrier power required for each set of limits. For further information, refer to the example provided earlier in this section for the ORFS Due To Modulation Absolute Limits—MS command.

Factory Preset: Refer to Table 4-41.

Range: −150 dBm to 150 dBm

Default Unit: dBm

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SElect to set the mode.

Front Panel Access: None

**EDGE ORFS Due To Switching Transients GSM MS Limits**

:CALCulate:EORFspectr:SWITching:LIMit:GSM|GSM900:MS:<Pnn> [:ABSolute][:UPPer]:DATA[n]?

Set or query any of the GSM MS related absolute limits for the EDGE ORFS due to switching transients measurement. Replace <Pnn> in the above command strings with the appropriate MS TX Level. The measured total carrier power will determine which row of limits will be applied.

Table 4-42 shows how each <Pnn> is associated with a value that must be referenced using a numeric from 1 to 5. Replace nn in the above command strings with the appropriate numeric to set or query the desired relative limit for the required offset frequency. You can also change the values in the Power column (n=1) to alter the carrier power required for each set of limits.

Example 1:

The following command sets the result limit to −10.0 dBm (the default value is −13.0 dBm) when testing a GSM MS device, total carrier power 39 dBm, at 400 kHz offset:
Example 2:
The following command configures the limits to use the P39 limits when the total carrier power level is +38dBm (instead of the default +39.0 dBm) when testing a GSM MS device:

```
:UPPer:DATA2 -10.0
```

Factory Preset: Refer to Table 4-42.

Range: −150 dBm to 150 dBm

Default Unit: dBm

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel Access: None

EDGE ORFS Due To Switching Transients PCS MS Limits

:CALCulate:EORFspectr:SWITching:LIMIT:PCS|PCS1900:MS:<Pnn>[:ABSolute][:UPPer]:DATA[n]?

Set or query any of the PCS MS absolute limit related commands for the EDGE ORFS due to switching transients measurement. Replace <Pnn> in the above command strings with the appropriate MS TX Level. The measured total carrier power will determine which row of limits will be applied.

Table 4-43 shows how each <Pnn> is associated with a value that must be referenced using a numeric from 1 to 5. Replace nn in the above command strings with the appropriate numeric to set or query the desired relative limit for the required offset frequency. You can also change the values in the Power column (n=1) to alter the carrier power required for each set of limits. For further information, refer to the example provided earlier in this section for the ORFS Due To Modulation Absolute Limits—MS command.

Factory Preset: Refer to Table 4-43.

Range: −150 dBm to 150 dBm
Default Unit: dBm
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.

CALCulate:MARKers Subsystem

This subsystem is documented in the ESA User’s and Programmer’s Reference. The GMSK phase and frequency, GMSK and EDGE output RF spectrum, and EDGE error vector magnitude measurements do not support the use of markers.

Markers can be put on your displayed measurement data to supply information about specific points on the data. Some of the things that markers can be used to measure include: precise frequency at a point, minimum or maximum amplitude, and the difference in amplitude or frequency between two points.

When using the marker commands you must specify the measurement in the SCPI command. We recommend that you use the marker commands only on the current measurement. Many marker commands will return invalid results, when used on a measurement that is not current. (This is true for commands that do more than simply setting or querying an instrument parameter.) No error is reported for these invalid results.

You must make sure that the measurement is completed before trying to query the marker value. Using the MEASure or READ command, before the marker command, forces the measurement to complete before allowing the next command to be executed.

Each measurement has its own instrument state for marker parameters. Therefore, if you exit the measurement, the marker settings in each measurement are saved and are then recalled when you change back to that measurement.

GSM (with EDGE) Mode - <measurement> key words

- CFLocation - markers available
- EEVM - no markers
- EORFspectr - no markers
- EPVTTime - markers available
- MONitor - markers available
- OOBSpur - markers available
- ORFSpectrum - no markers
- PFERror - no markers
- PSTeps - markers available
- PVTTime - markers available
- RSPur - markers available
- TSPur - markers available
- TXPower - no markers

Example:

Suppose you are using the Spectrum measurement in your measurement personality. To position marker 2 at the maximum peak value of the trace that marker 2 is currently on, the command is:
:CALCulate:SPECTrum:MARKer2:MAXimum

You must make sure that the measurement is completed before trying to query the marker value. Use the MEASure or READ command before using the marker command. This forces the measurement to complete before allowing the next command to be executed.

Markers All Off on All Traces

:CALCulate:<measurement>:MARKer:AOFF

Turns off all markers on all the traces in the specified measurement.

Example: CALC:SPEC:MARK:AOFF

Remarks: The keyword for the current measurement must be specified in the command. (Some examples include: SPECTrum, WAVEform)

Front Panel Access: Marker, More, Marker All Off

Marker Mode

POStion|DELTa|OFF

:CALCulate:<measurement>:MARKer[1]|2|3|4:MODE?

Selects the type of markers that you want to activate.

Position – selects a normal marker that can be positioned on a trace and from which trace information will be generated.

Delta – When a Marker is set to Delta, the next marker is used as the Reference Marker and its Mode is set to Normal (POStion). The value of the Delta Marker is the relative value from the Reference Marker. When Marker4 is set to Delta, Marker1 is used as the Reference Marker.

Front Panel Access: Marker, Off
Marker, Normal
Marker, Delta

Marker State

:CALCulate:<measurement>:MARKer[1]|2|3|4[:STATe] OFF|ON|0|1

:CALCulate:<measurement>:MARKer[1]|2|3|4[:STATe]?
Turns the selected marker on or off.

The marker must have already been assigned to a trace. Use `:CALCulate:<measurement>:MARKer[1]|2|3|4:TRACe` to assign a marker to a particular trace.

Example: `CALC:CFL:MARK2: on`

Remarks: The keyword for the current measurement must be specified in the command. (Some examples include: SPECtrum, AREFerence, CFLocation, WAVeform)

You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel Access: Marker, Select then Marker Normal

---

**Marker X Value**

`:CALCulate:<measurement>:MARKer[1]|2|3|4:X <param>`

`:CALCulate:<measurement>:MARKer[1]|2|3|4:X?`

Position the designated marker on its assigned trace at the specified X value. The parameter value is in X-axis units (which is often frequency or time).

The query returns the current X value of the designated marker. The measurement must be completed before querying the marker.

Example: `CALC:CFL:MARK2:X 10.00 m`

Default Unit: Matches the units of the trace on which the marker is positioned

Remarks: The keyword for the current measurement must be specified in the command. (Some examples include: LPLot, ACP, CFLocation, WAVeform)

You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel Access: Marker, <active marker>, RPG

---

**Marker Readout Y Value**

Readout the current Y value for the designated marker on its assigned trace. The value is in the Y-axis units for the trace (which is often dBm).

The measurement must be completed before querying the marker.
Example: \texttt{CALC:CFL:MARK1:Y?}

Default Unit: Matches the units of the trace on which the marker is positioned

Remarks: The keyword for the current measurement must be specified in the command. (Some examples include: LPLot, ACP, CFLocation, WAVeform)

You must be in GSM, EDGE mode to use this command. Use INSTRument:SE lect to set the mode.
Out Of Band Spurious Emissions (OOBS) Absolute Limits Commands

The commands in this section are presented according to the following devices: MS, BTS, UBTS1, UBTS2, UBTS3 and PBTS1.

OOBS Absolute Limits Commands—BTS

:CALCulate:OOBSpur:LIMit:<standard>:BS|BTS[:UPPer]:DATA[n] <amplitude>

:CALCulate:OOBSpur:LIMit:<standard>:BS|BTS[:UPPer]:DATA[n]?

Set or query any of the MS related limits for the out of band spurious measurement. Replace <standard> in the above command strings with the appropriate keyword or abbreviated keyword from the table below.

Table 4-45 shows how each <standard> is associated with a value that must be referenced using a numeric from 1 to 6. Replace n in the above command strings with the appropriate numeric to set or query the desired limit.

Factory Preset: Limit values default to the GSM450 / GSM480 / GSM850 / PGSM900 / EGSM900 / RGSM900 / DCS1800 / PCS1900 standards as shown in Table 4-45.

Range: −150 dBm to 150 dBm

Default Unit: dBm

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Output RF Spectrum - Limits

Output RF Spectrum (ORFS) Due To Modulation Absolute Limits Commands

Use the commands in this section to change the output RF spectrum absolute limits to your own custom limits values.

ORFS limits are generally specified in dB relative to the reference power (ref power). This equates to the absolute power which the result must not exceed. Standards documents also supply an absolute power level—below which the calculated relative limit (ref power – relative limit) will not be applied—for each ORFS type, radio standard, device type and offset frequency.

Therefore the relative limit applies if the calculated limit (ref power – relative limit) is greater than the absolute limit. Otherwise the absolute limit applies.

Example:

If relative limit = −75 dB and absolute limit = −65 dBm.

Table 4-56

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>If the ref power is measured at 43 dBm, then:</td>
</tr>
<tr>
<td></td>
<td>Upper result limit due to relative limit = 43 – 75 = −32 dBm</td>
</tr>
<tr>
<td></td>
<td>Upper result limit due to absolute limit = −65 dBm</td>
</tr>
<tr>
<td></td>
<td>A relative limit of −32 dBm therefore applies.</td>
</tr>
<tr>
<td>2.</td>
<td>If the ref power is measured at 0 dBm, then:</td>
</tr>
<tr>
<td></td>
<td>Upper result limit due to relative limit = 0 – 75 = −75 dBm</td>
</tr>
<tr>
<td></td>
<td>Upper result limit due to absolute limit = −65 dBm</td>
</tr>
<tr>
<td></td>
<td>An absolute limit of −65 dBm therefore applies.</td>
</tr>
</tbody>
</table>

The commands are presented according to the following devices: MS, BTS, UBTS1, UBTS2, UBTS3 and PBTS1.

ORFS Due To Modulation Absolute Limits—BTS

Set or query any of the absolute BTS related limits for the ORFS due to
modulation measurement. Replace <standard> in the above command strings with GSM or GSM900, DCS or DCS1800, or PCS or PCS1900. Note that GSM applies to all of GSM450, GSM480, GSM850, PGSM900, EGSM900 and RGSM900.

Table 4-57 below shows how each <standard> is associated with a value that must be referenced using numeric 1 or 2. Replace n in the above command strings with the appropriate numeric to set or query the desired limit. For further information, refer to the example provided earlier in this section (page 202) for the ORFS Due To Modulation Absolute Limits—MS command.

Factory Preset: Refer to Table 4-57.

Range: −150 dBm to 150 dBm
Default Unit: dBm
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELect to set the mode.

Front Panel Access: None

Table 4-57  ORFS Due To Modulation Absolute Limits—BTS: Default Values

<table>
<thead>
<tr>

</tr>
<tr>
<td>≥ 1800 kHz (n=2)</td>
<td>−65.0</td>
<td>−57.0</td>
<td>−57.0</td>
</tr>
</tbody>
</table>

ORFS Due To Modulation Absolute Limits—MS

:CALCulate:ORFSpectrum:MODulation:LIMit:<standard>:MS:ABSolute[:UPPer]:DATA[n]?

Set or query any of the absolute MS related limits for the ORFS due to modulation measurement. Replace <standard> in the above command strings with GSM or GSM900, DCS or DCS1800, or PCS or PCS1900. Note that GSM applies to all of GSM450, GSM480, GSM850, PGSM900, EGSM900 and RGSM900.

Table 4-58 below shows how each <standard> is associated with a value that must be referenced using a numeric from 1 to 3. Replace n in the above command strings with the appropriate numeric to set or query
the desired limit.

Example:

The following command sets the absolute result limit to $-40$ dBm when testing a PGSM MS device at $1800$ kHz offset (the default value is $-46.0$ dBm):

```
```

Factory Preset: Refer to Table 4-58.

Range: $-150$ dBm to $150$ dBm

Default Unit: dBm

Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

Front Panel Access: None

</tr>
</tbody>
</table>

**ORFS Due To Modulation Absolute Limits—PBTS1**

```
```

```
```

Set or query any of the absolute PBTS1 related limits for the ORFS due to modulation measurement. Replace `<standard>` in the above command strings with GSM or GSM900, DCS or DCS1800, or PCS or PCS1900. Note that GSM applies to all of GSM450, GSM480, GSM850, PGSM900, EGSM900 and RGSM900.

**Table 4-59** below shows how each `<standard>` is associated with a value that must be referenced using the numeric 1 or 2. Replace n in the
above command strings with 1 or 2 to set or query the desired limit. For further information, refer to the example provided earlier in this section (page 202) for the ORFS Due To Modulation Absolute Limits—MS command.

Factory Preset: Refer to Table 4-59.

Range: \(-150 \text{ dBm} \text{ to } 150 \text{ dBm}\)

Default Unit: dBm

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELect to set the mode.

ORFS Due To Modulation Absolute Limits—UBTS3

Set or query any of the absolute UBTS3 related limits for the ORFS due to modulation measurement. Replace <standard> in the above command strings with GSM or GSM900, DCS or DCS1800, or PCS or PCS1900. Note that GSM applies to all of GSM450, GSM480, GSM850, PGSM900, EGSM900 and RGSM900.

Table 4-62 below shows how each <standard> is associated with a value that must be referenced using the numeric 1 or 2. Replace n in the above command strings with 1 or 2 to set or query the desired limit. For further information, refer to the example provided earlier in this section (page 202) for the ORFS Due To Modulation Absolute Limits—MS command.

Factory Preset: Refer to Table 4-62.

Range: −150 dBm to 150 dBm

Default Unit: dBm

Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

Front Panel Access: None
Output RF Spectrum (ORFS) Due To Modulation Relative Limits Commands

Use the commands in this section to change the output RF spectrum relative limits to your own custom limits values.

ORFS limits are generally specified in dB relative to the reference power (ref power). This equates to the absolute power which the result must not exceed. Standards documents also supply an absolute power level—below which the calculated relative limit (ref power – relative limit) will not be applied—for each ORFS type, radio standard, device type and offset frequency.

Therefore the relative limit applies if the calculated limit (ref power – relative limit) is greater than the absolute limit. Otherwise the absolute limit applies.

Example:

If relative limit = −75 dB and absolute limit = −65 dBm.

Table 4-63

<table>
<thead>
<tr>
<th>Standard</th>
<th>Offset</th>
<th>GSM/ GSM900</th>
<th>DCS/ DCS1800</th>
<th>PCS/ PCS1900</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; 1800 kHz (n=1)</td>
<td>−69.0</td>
<td>−67.0</td>
<td>−67.0</td>
<td></td>
</tr>
<tr>
<td>≥ 1800 kHz (n=2)</td>
<td>−69.0</td>
<td>−67.0</td>
<td>−67.0</td>
<td></td>
</tr>
</tbody>
</table>

1. If the ref power is measured at 43 dBm, then:
   Upper result limit due to relative limit = 43 − 75 = −32 dBm
   Upper result limit due to absolute limit = −65 dBm
   A relative limit of −32 dBm therefore applies.

2. If the ref power is measured at 0 dBm, then:
   Upper result limit due to relative limit = 0 − 75 = −75 dBm
   Upper result limit due to absolute limit = −65 dBm
   An absolute limit of −65 dBm therefore applies.
The commands are presented according to standards DCS, GSM and PCS for devices MS, BTS and UBTS.

**ORFS Due To Modulation DCS Relative Limits—BTS**

Set or query any of the DCS 1800 BTS relative limits for the ORFS due to modulation measurement. Replace <Pnn> in the above command strings with the appropriate BS TX Level.

Table 4-64 below shows how each <Pnn> is associated with a value that must be referenced using a numeric from 1 to 9. Replace nn in the above command strings with the appropriate numeric to set or query the desired relative limit for the required offset frequency. For further information, refer to the example provided earlier in this section (page 208) for the ORFS Due To Modulation DCS Relative Limits—MS command.

---

**NOTE**

The relative limit applied depends on the measured total carrier power. If the measured total carrier power lies between these discrete power values noted in the table the limit value is linearly interpolated.

Factory Preset: Refer to Table 4-64.

Range: −150 dB to 150 dB

Default Unit: dB

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

**ORFS Due To Modulation DCS Relative Limits—MS**

:CALCulate:ORFSpectrum:MODulation:LIMit:DCS|DCS1800 :MS: <Pnn>[:UPPer]:DATA [n]?

Table 4-65 below shows how each <Pnn> is associated with a value that must be referenced using a numeric from 1 to 9. Replace nn in the above command strings with the appropriate numeric to set or query the desired relative limit for the required offset frequency.

Set or query any of the DCS 1800 MS relative limits for the ORFS due to modulation measurement. Replace <Pnn> in the above command strings with the appropriate MS TX Level.

**NOTE**

The relative limit applied depends on the measured total carrier power. If the measured total carrier power lies between these discrete power values noted in the table the limit value is linearly interpolated.

Example:

The following command sets the relative result limit to −65.0 dB (the default value is −60.0 dB) when testing a DCS MS device at 400 kHz offset and total carrier power = 36 dBm:

Factory Preset: Refer to Table 4-65.

Range: –150 dB to 150 dB

Default Unit: dB

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELe ct to set the mode.

Front Panel Access: None

#### ORFS Due To Modulation PCS Relative Limits—PBTS

:CALCulate:ORFSpectrum:MODulation:LIMit:PCS|PCS1900 :PBTS: <Pnn>[::UPPer]:DATA[n]?

Set or query any of the PCS 1900 PBTS relative limits for the ORFS due to modulation measurement. Replace <Pnn> in the above command strings with the appropriate BS TX Level.

Table 4-74 below shows how each <Pnn> is associated with a value that must be referenced using a numeric from 1 to 9. Replace nn in the above command strings with the appropriate numeric to set or query the desired relative limit for the required offset frequency. For further information, refer to the example provided earlier in this section (page 208) for the ORFS Due To Modulation DCS Relative Limits—MS command.

---

**NOTE**

The relative limit applied depends on the measured total carrier power.
If the measured total carrier power lies between these discrete power values noted in the table the limit value is linearly interpolated.

Factory Preset: Refer to Table 4-74.
Range: 
−150 dB to 150 dB
Default Unit: dB
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELect to set the mode.

:UBTS :<Pnn>[[:UPPer]:DATA[n] <amplitude>

:CALCulate:ORFSpectrum:MODulation:LIMit:PCS | PCS1900
:UBTS :<Pnn>[[:UPPer]:DATA[n]?

Set or query any of the PCS 1900 UBTS relative limits for the ORFS due to modulation measurement. Replace <Pnn> in the above command strings with the appropriate BS TX Level.

Table 4-75 below shows how each <Pnn> is associated with a value that must be referenced using a numeric from 1 to 9. Replace nn in the above command strings with the appropriate numeric to set or query the desired relative limit for the required offset frequency. For further information, refer to the example provided earlier in this section (page 208) for the ORFS Due To Modulation DCS Relative Limits—MS command.

NOTE
The relative limit applied depends on the measured total carrier power.
If the measured total carrier power lies between these discrete power values noted in the table the limit value is linearly interpolated.

Factory Preset: Refer to Table 4-75.

Range: $-150 \text{ dB}$ to $150 \text{ dB}$

Default Unit: dB

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELect to set the mode.

#### Output RF Spectrum (ORFS) Due To Switching Transients Absolute Limits Commands—BTS, PBTS and UBTS

Use the commands in this section to change the output RF spectrum due to switching transients absolute limits to your own custom limits values.

ORFS limits are generally specified in dB relative to the reference power (ref power). This equates to the absolute power which the result must not exceed. Standards documents also supply an absolute power level—below which the calculated relative limit (ref power – relative limit) will not be applied—for each ORFS type, radio standard, device...
type and offset frequency.

Therefore the relative limit applies if the calculated limit (ref power – relative limit) is greater than the absolute limit. Otherwise the absolute limit applies.

Example:

If relative limit = −75 dB and absolute limit = −65 dBm.

Table 4-76

<table>
<thead>
<tr>
<th>1. If the ref power is measured at 43 dBm, then:</th>
<th>2. If the ref power is measured at 0 dBm, then:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upper result limit due to relative limit = 43 − 75 = −32 dBm</td>
<td>Upper result limit due to relative limit = 0 − 75 = −75 dBm</td>
</tr>
<tr>
<td>Upper result limit due to absolute limit = −65 dBm</td>
<td>Upper result limit due to absolute limit = −65 dBm</td>
</tr>
<tr>
<td>A relative limit of −32 dBm therefore applies.</td>
<td>An absolute limit of −65 dBm therefore applies.</td>
</tr>
</tbody>
</table>

Note that for ORFS due to switching transients the above only applies to BTS, U BTS and PBTS devices as MS limits are specified in absolute terms (dBm) only.

The commands are presented according to devices BTS, U BTS1, U BTS2, U BTS3 and PBTS1.

**ORFS Due To Switching Transients Absolute Limits—BTS**

Set or query any of the absolute BTS related limits for the ORFS due to switching transients measurement. Replace <standard> in the above command strings with GSM, DCS or PCS. Note that GSM applies to all of GSM450, GSM480, GSM850,PGSM900, EGSM900 and RGSM900.

Table 4-77 shows how each <standard> is associated with a value that must be referenced using the numerics 1 or 2. Replace n in the above command strings with the appropriate numeric to set or query the desired limit.

Example:
The following command sets the absolute result limit to $-40$ dBm when testing an E-GSM BTS device for offsets $\geq 1800$ kHz (the default value is $-36.0$ dBm):

\[
:UPPer:DATA2 \ -40.0
\]

Factory Preset: Refer to Table 4-77.

Range: $-150$ dBm to $150$ dBm

Default Unit: dBm

Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

Front Panel Access: None

ORFS Due To Switching Transients Absolute Limits—UBTS3

Set or query any of the absolute UBTS3 related limits for the ORFS due to switching transients measurement. Replace <standard> in the above command strings with GSM, DCS or PCS. Note that GSM applies to all of GSM450, GSM480, GSM850, PGSM900, EGSM900 and RGSM900.

Table 4-81 shows how each <standard> is associated with a value that must be referenced using the numeric 1. Replace n in the above command strings with 1 to set or query the desired limit. For further information, refer to the example provided earlier in this section (page 223) for the ORFS Due To Switching Transients Absolute Limits—BTS command.

Factory Preset: Refer to Table 4-81.

Range: −150 dBm to 150 dBm

Default Unit: dBm

Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.
Output RF Spectrum (ORFS) Due To Switching Transients
Relative Limits Commands—BTS, PBTS and UBTS

Use the commands in this section to change the output RF spectrum
due to switching transients relative limits to your own custom limits
values.

ORFS limits are generally specified in dB relative to the reference
power (ref power). This equates to the absolute power which the result
must not exceed. Standards documents also supply an absolute power
level—below which the calculated relative limit (ref power − relative
limit) will not be applied—for each ORFS type, radio standard, device
type and offset frequency.

Therefore the relative limit applies if the calculated limit (ref power −
relative limit) is greater than the absolute limit. Otherwise the absolute
limit applies.

Example:

If relative limit = −75 dB and absolute limit = −65 dBm.

Table 4-82

1. If the ref power is measured at 43 dBm, then:
   
   Upper result limit due to relative limit = 43 − 75 = −32 dBm
   Upper result limit due to absolute limit = −65 dBm

   A relative limit of −32 dBm therefore applies.

2. If the ref power is measured at 0 dBm, then:

   Upper result limit due to relative limit = 0 − 75 = −75 dBm
   Upper result limit due to absolute limit = −65 dBm

   An absolute limit of −65 dBm therefore applies.
Note that for ORFS due to switching transients the above only applies to BTS and UBTS devices as MS limits are specified in absolute terms (dBm) only.

**ORFS Due To Switching Transients Relative Limits—DCS**

:CALCulate:ORFSpectrum:SWITching:LIMit:DCS|DCS1800:<device> [:UPPer]:DATA[n]?

Set or query any of the relative DCS related limits for the ORFS due to switching transients measurement. Replace `<device>` in the above command strings with the appropriate entry.

Table 4-83 shows how each `<device>` is associated with a value that must be referenced using a numeric from 2 to 5. Replace n in the above command strings with the appropriate numeric to set or query the desired relative limit for the required offset frequency. Note that entries in the Power column (n=1) are currently not used. For further information, refer to the example provided earlier in this section (page 228) for the ORFS Due To Switching Transients Relative Limits—GSM command.

Factory Preset: Refer to Table 4-83.

Range: −150 dB to 150 dB

Default Unit: dB

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELect to set the mode.

Front Panel Access: None

**Table 4-83 ORFS Due To Switching Transients Relative Limits—DCS: Default Values**

ORFS Due To Switching Transients Relative Limits—GSM

:CALCulate:ORFSpectrum:SWITching:LIMin:GSM|GSM900
:<device> [:UPPer]:DATA[n] <amplitude>

:CALCulate:ORFSpectrum:SWITching:LIMin:GSM|GSM900
:<device> [:UPPer]:DATA[n]?

Set or query any of the relative GSM related limits for the ORFS due to switching transients measurement. Replace <device> in the above command strings with the appropriate entry.

Table 4-84 shows how each <device> is associated with a value that must be referenced using a numeric from 2 to 5. Replace n in the above command strings with the appropriate numeric to set or query the desired relative limit for the required offset frequency. Note that entries in the Power column (n=1) are currently not used.

Example:

The following command sets the relative result limit to −70 dB (the default value is −74.0 dB) when testing a GSM BTS device at 1200 kHz offset:

:CALCulate:ORFSpectrum:SWITching:LIMin:GSM:BTS:UPPer:DATA4 −70.0

Factory Preset: Refer to Table 4-84.

Range: −150 dB to 150 dB

Default Unit: dB

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel Access: None

Output RF Spectrum (ORFS) Due To Switching Transients
Absolute Limit Command—MS

Use the commands in this section to change the output RF spectrum.
due to switching transients limits for MS devices, to your own custom limits values. The output RF spectrum due to switching transients test for MS devices, uses limits that are specified in absolute units—that is, dBm.

Note that the limit applied—as shown in the table that accompanies each command—depends on the total carrier power. If the measured carrier power lies between these discrete power values, the limit value is linearly interpolated. If it lies above or below the range specified, the upper or lower limit set are used respectively.

NOTE

Due to changes in 3GPP specifications for ORFS due to switching transients, the commands listed below are no longer supported:

ORFS Due To Switching Transients DCS MS Limits

:CALCulate:ORFSpectrum:SWITching:LIMit:DCS|DCS1800
:MS:<Pnn>: [ABSolute] [:UPPer]:DATA[n] <amplitude>

:CALCulate:ORFSpectrum:SWITching:LIMit:DCS|DCS1800
:MS:<Pnn>: [ABSolute] [:UPPer]:DATA[n]?

Set or query any of the DCS MS related commands for the ORFS due to switching transients measurement. Replace <Pnn> in the above command strings with the appropriate MS TX Level. The measured total carrier power will determine which row of limits will be applied.

Table 4-86 shows how each <Pnn> is associated with a value that must be referenced using a numeric from 1 to 5. Replace nn in the above command strings with the appropriate numeric to set or query the desired relative limit for the required offset frequency. You can also change the values in the Power column (n=1) to alter the carrier power required for each set of limits. For further information, refer to the examples provided in this section for the ORFS Due To Switching Transients GSM MS Limits command.

Factory Preset: Refer to Table 4-86.

Range: −150 dBm to 150 dBm

Default Unit: dBm

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel Access: None

ORFS Due To Switching Transients DCS MS Limits: Default Values

Set or query any of the GSM MS related absolute limits for the ORFS due to switching transients measurement. Replace <Pnn> in the above command strings with the appropriate MS TX Level. The measured total carrier power will determine which row of limits will be applied.

Table 4-87 shows how each <Pnn> is associated with a value that must be referenced using a numeric from 1 to 5. Replace nn in the above command strings with the appropriate numeric to set or query the desired relative limit for the required offset frequency. You can also change the values in the Power column (n=1) to alter the carrier power required for each set of limits.

Example 1:

The following command sets the result limit to −30.0 dBm (the default value is −13.0 dBm) when testing a GSM MS device, total carrier power 39 dBm, at 400 kHz offset:
Programming Commands
CALCulate Subsystem

Example 2:

The following command configures the limits to use the P39 limits when the total carrier power level is less than or equal to +38dBm (instead of the default +39.0 dBm) when testing a GSM MS device:

Factory Preset: Refer to Table 4-87.
Range: −150 dBm to 150 dBm
Default Unit: dBm
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel Access: None

ORFS Due To Switching Transients PCS MS Limits

:CALCulate:ORFSpectrum:SWITching:LIMit:PCS|PCS1900
:MS:<Pnn>:[ABSolute][:UPPer]:DATA[n] <amplitude>

:CALCulate:ORFSpectrum:SWITching:LIMit:PCS|PCS1900
:MS:<Pnn>:[ABSolute][:UPPer]:DATA[n]?

Set or query any of the PCS MS related commands for the ORFS due to switching transients measurement. Replace <Pnn> in the above command strings with the appropriate MS TX Level. The measured total carrier power will determine which row of limits will be applied.

Table 4-88 shows how each <Pnn> is associated with a value that must be referenced using a numeric from 1 to 5. Replace nn in the above command strings with the appropriate numeric to set or query the desired relative limit for the required offset frequency. You can also change the values in the Power column (n=1) to alter the carrier power required for each set of limits. For further information, refer to the examples provided earlier in this section for the ORFS Due To Switching Transients GSM MS Limits command.

Factory Preset: Refer to Table 4-88.

Range: $-150 \text{ dBm to } 150 \text{ dBm}$

Default Unit: dBm

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SElect to set the mode.

Front Panel Access: None

**CONFigure Subsystem**

The CONFigure commands are used with several other commands to control the measurement process. The full set of commands are described in the section “MEASure Group of Commands” on page 258.

Selecting measurements with the CONFigure/FETCH/MEASure/READ commands sets the instrument state to the defaults for that measurement and to make a single measurement. Other commands are available for each measurement to allow you to change: settings, view, limits, etc. Refer to:

SENSe:<measurement>, SENSe:CHANnel, SENSe:CORRection, SENSe:DEFaults, SENSe:DEViation, SENSe:FREQuency, SENSe:PACKet, SENSe:POWer, SENSe:RADio, SENSe:SYNC
CALCulate:<measurement>, CALCulate:CLIMits
DISPlay:<measurement>
TRIGger

The INITiate[:IMMediate] or INITiate:RESTart commands will initiate the taking of measurement data without resetting any of the measurement settings that you have changed from their defaults.

**Configure the Selected Measurement**

:CONFigure:<measurement>

A CONFigure command must specify the desired measurement. It will set the instrument settings for that measurement’s standard defaults, but should not initiate the taking of data. The available measurements are described in the MEASure subsystem.

**NOTE**

This command sets Averaging to On and sets the number of averages to 10.
### DISPlay Subsystem

The DISPlay controls the selection and presentation of textual, graphical, and TRACe information. Within a DISPlay, information may be separated into individual WINDows.

### Display Annotation Title Data

:DISPlay:ANNotation:TITLe:DATA <string>
:DISPlay:ANNotation:TITLe:DATA?

Enters the text that will be displayed in the user title area of the display.

**Front Panel Access:**
- Display, Title
- Display, Title, Change Title
- Display, Title, Clear Title

### Display EDGE Output RF Spectrum Measurement Results

:DISPlay:EORFSpectr:TABLe RESults|LIMits|MARGins
:DISPlay:EORFSpectr:TABLe?

Displays the EDGE Output RF Spectrum Measurement results in tabular form, allowing the user to switch between displaying results, applied limits and margins of error for six offset frequencies.

**Factory Preset:** Results

**Front Panel Access:**
- Display

### Display Output RF Spectrum Measurement Results

:DISPlay:ORFSpectrum:TABLe RESults|LIMits|MARGins

Displays the Output RF Spectrum Measurement results in tabular form, allowing the user to switch between displaying results, applied limits and margins of error for six offset frequencies.

**Factory Preset:** Results
Programming Commands

DISPlay Subsystem

Front Panel
Access: Display

Set the Display Line

:DISPlay:WINDow:TRACe:Y:DLINe <ampl>
:DISPlay:WINDow:TRACe:Y:DLINe?

Defines the level of the display line, in the active amplitude units if no units are specified.

Factory Preset: 2.5 divisions below the reference level

Range: 10 display divisions below the reference level to the reference level

Default Unit: Current active units

Front Panel
Access: Display, Display Line

Control the Display Line

:DISPlay:WINDow:TRACe:Y:DLINe:STATe OFF|ON|0|1
:DISPlay:WINDow:TRACe:Y:DLINe:STATe?

Turns the display line on or off.

Factory Preset: Off

Front Panel
Access: Display, Display Line
FETCh Subsystem

The FETCh? queries are used with several other commands to control the measurement process. These commands are described in the section on the “MEASure Group of Commands” on page 258. These commands apply only to measurements found in the MEASURE menu.

This command puts selected data from the most recent measurement into the output buffer (new data is initiated/measured). Use FETCh if you have already made a good measurement and you want to look at several types of data (different [n] values) from the single measurement. FETCh saves you the time of re-making the measurement. You can only fetch results from the measurement that is currently active.

If you need to make a new measurement, use the READ command, which is equivalent to an INITiate[:IMMediate] followed by a FETCh.

:FETCh <meas>? will return valid data only when the measurement is in one of the following states:

- idle
- initiated
- paused

Fetch the Current Measurement Results

:FETCh:<measurement>[n]?

A FETCh? command must specify the desired measurement. It will return the valid results that are currently available, but will not initiate the taking of any new data. You can only fetch results from the measurement that is currently selected. The code number n selects the kind of results that will be returned. The available measurements and data results are described in the “MEASure Group of Commands” on page 258.
INITiate Subsystem

The INITiate subsystem is used to initiate a trigger for a sweep or measurement. “Measurement” refers to the functions found under the MEASURE front panel key or in the “MEASure Group of Commands” on page 258. Refer also to the TRIGger and ABORt subsystems for related commands.

Continuous or Single Measurements

:INITiate:CONTinuous OFF|ON|0|1

:INITiate:CONTinuous?

Selects whether the trigger system is continuously initiated, or not.

This command affects the sweep in Spectrum Analysis mode, and affects measurement triggering when in a measurement. A “measurement” refers to any of the functions under the MEASURE key.

NOTE

This command operates in the same manner whether you are triggering a sweep cycle, or triggering a measurement cycle.

- When ON, at the completion of each sweep/measurement cycle the sweep/measurement system immediately initiates another sweep/measurement cycle.
- When OFF, the sweep/measurement system remains in the “idle” state until INITiate:CONTinuous is set to ON or an :INITiate[:IMMediate] command is received. On receiving the :INITiate[:IMMediate] command, a single sweep/measurement occurs followed by a return to the “idle” state.
- The query returns 1 or 0 into the output buffer. 1 is returned when there is continuous sweeping/measurement triggering. 0 is returned when there is single sweeping/measurement triggering.

Example: INIT:CONT ON

Factory Preset: On (Off is usually recommended for remote operation.)

Front Panel Access: Meas Control

Take New Data Acquisitions

:INITiate[:IMMediate]

The command causes the system to exit the “idle” state and go to the “initiated” state. Once the trigger conditions are met, the
sweep/measurement will start.

The instrument must be in the single sweep/measurement mode. The command is ignored if:

- INIT:CONT is ON
- a measurement is selected (any function under the MEASURE key), but it is not waiting in the “idle” state.

It then completes one full trigger cycle and returns to the “idle” state on completion of the sweep/measurement. (If you have selected averaging, or are in a measurement, it may average several sweeps/measurements. So there can be multiple data acquisitions, with multiple trigger events, for one full trigger cycle.)

Use the TRIGer[:SEQuence]:SOURce EXT command to select the external trigger source. If you are making a measurement (using a function from the MEASure subsystem), you may need to use a [:SENSe]:<meas>:TRIGger:SOURce command to select the desired trigger.

Use :FETCh:<meas>? to transfer a measurement result from memory to the output buffer. Refer to individual commands in the FETCh subsystem for more information.

While the system is in the “initiated” state, additional :INIT command(s) will restart the sweep/measurement. If averaging is on, the averaging will be reset.

Example: INIT:IMM

Remarks: See also the *TRG command and the TRIGger subsystem.

Front Panel Access: Meas Control, Restart
Pause the Measurement

:INITiate:PAUSE

Pauses the current measurement by changing the current measurement state from the “wait for trigger” state to the “paused” state. If the measurement is not in the “wait for trigger” state, when the command is issued, the transition will be made the next time that state is entered as part of the trigger cycle. When in the paused state, the spectrum analyzer auto-align process stops. If the analyzer is paused for a long period of time, measurement accuracy may degrade.

Example: INIT:PAUS

Front Panel Access: Meas Control, Pause

Restart the Measurement

:INITiate:RESTART

This command applies to measurements found in the MEASURE menu. It restarts the current measurement from the “idle” state regardless of its current operating state. It is equivalent to:

INITiate[:IMMediate] ABORt (for continuous measurement mode)

Example: INIT:REST

Front Panel Access: Restart
  or
  Meas Control, Restart

Resume the Measurement

:INITiate:RESume

Resumes the current measurement by changing the current measurement state from the “paused state” back to the “wait for trigger” state. If the measurement is not in the “paused” state, when the command is issued, an error is reported.

Example: INIT:RES

Front Panel Access: Meas Control, Resume
INSTRument Subsystem

This subsystem includes commands for querying and selecting instrument measurement (personality option) modes.

Catalog Query

:INSTRument:CATalog?

Returns a comma separated list of strings which contains the names of all the installed applications. These names can only be used with the INSTR:SELECT command.

Example:

INST:CAT?

Query response: "CDMA,PNOISE"

Select Application by Number

:INSTRument:NSELect <integer>

:INSTRument:NSELect?

Select the measurement mode by its instrument number. The actual available choices depends upon which applications are installed in the instrument.

1 = SA
3 = GSM or GSM w/EDGE
4 = CDMA (cdmaOne)
14 = PNOISE (phase noise)
219 = NOISEFIGURE
228 = BLUETOOTH
227 = CATV (Cable TV)
229 = MAN (Modulation Analysis)
231 = LINK (89600 VSA Link Software)
266 = 8566/68 Programming Compatibility
290 = 8590 Series Programming Compatibility
NOTE

If you are using the SCPI status registers and the analyzer mode is changed, the status bits should be read, and any errors resolved, prior to switching modes. Error conditions that exist prior to switching modes cannot be detected using the condition registers after the mode change. This is true unless they recur after the mode change, although transitions of these conditions can be detected using the event registers.

Changing modes resets all SCPI status registers and mask registers to their power-on defaults. Hence, any event or condition register masks must be re-established after a mode change. Also note that the power up status bit is set by any mode change, since that is the default state after power up.

Example: INST:NSEL 4
Factory Preset: Persistent state with factory default of 1
Range: 1 to x, where x depends upon which applications are installed.

Front Panel Access: MODE

Select Application

ESA Series:

:INSTRument[:SELect]?

Select the measurement mode. The actual available choices depend upon which modes (measurement applications) are installed in the instrument. A list of the valid choices is returned with the INST:CAT? query.

Once an instrument mode is selected, only the commands that are valid for that mode can be executed.

1 = SA
3 = GSM or GSM w/EDGE
4 = CDMA (cdmaOne)
14 = PNOISE (phase noise)
219 = NOISEFIGURE
228 = BLUETOOTH
227 = CATV (Cable TV)
229 = MAN (Modulation Analysis)
231 = LINK (89600 VSA Link Software)
266 = 8566/68 Programming Compatibility
290 = 8590 Series Programming Compatibility
NOTE

If you are using the status bits and the analyzer mode is changed, the status bits should be read, and any errors resolved, prior to switching modes. Error conditions that exist prior to switching modes cannot be detected using the condition registers after the mode change. This is true unless they recur after the mode change, although transitions of these conditions can be detected using the event registers.

Changing modes resets all SCPI status registers and mask registers to their power-on defaults. Hence, any event or condition register masks must be re-established after a mode change. Also note that the power up status bit is set by any mode change, since that is the default state after power up.

Example: INST:SEL ‘CDMA’

Factory Preset: Persistent state with factory default of Spectrum Analyzer mode

Front Panel Access: MODE
MEASure Group of Commands

This group includes the CONFigure, FETCH, MEASure, and READ commands that are used to make measurements and return results. The different commands can be used to provide fine control of the overall measurement process, like changing measurement parameters from their default settings. Most measurements should be done in single measurement mode, rather than measuring continuously.
Cable Fault Location Measurement

Displays the reflected signal of a transmission line as a function of the distance down the line. This complements the return loss measurement. If a cable under test fails a return loss measurement, the cable fault location measurement can be used to identify the location of the fault. The measurement is particularly useful when a base station and antenna are connected by a long length of cable.

The general functionality of CONFigure, FETCH, MEASURE, and READ are described at the beginning of this section. See the SENSE:CFLocation commands for more measurement related commands.

:CONFigure:CFLocation
:FETCH:CFLocation[n]?  
:READ:CFLocation[n]?
:MEASURE:CFLocation[n]?

Front Panel Access: Measure, Cable Fault Location

After the measurement is selected, press Restore Meas Defaults to restore factory defaults.

Measurement Results Available

</table>
### MEASure Group of Commands

#### Programming Commands

<table>
<thead>
<tr>
<th>Measurement Method</th>
<th>n</th>
<th>Results Returned</th>
</tr>
</thead>
</table>
| Multiple offsets   | n=1 (or not specified) | Returns a list of values for the modulation spectrum at all the offsets (lower and upper). This is followed by the switching transients results at all the offsets (lower and upper). Note that the carrier is considered offset zero (0) and is the first set of results sent. Four values are provided for each of the offsets (including the carrier), in this order:  
  1. Negative offset(a) - power relative to carrier (dB)  
  2. Negative offset(a) - absolute average power (dBm)  
  3. Positive offset(a) - power relative to carrier (dB)  
  4. Positive offset(a) - absolute average power (dBm)  

Values for all possible offsets are sent. Zeros are sent for offsets that have not been defined. The total number of values sent is:  
\[(120) = (4 \text{ results/offset}) \times (15 \text{ offsets}) \times (2 \text{ measurement types - modulation & switching})\]

Carrier - modulation measurement values  
Offset 1 - modulation measurement values and so on  
Offset 14 - modulation measurement values  
Carrier - switching transients measurement values  
Offset 16 - switching transients measurement values  
Offset 29 - switching transients measurement values and so on  

This measurement defaults to modulation measurements and not switching measurements. If you want to return the switching measurement values, you must change that default condition and use FETCH or READ to return values, rather than MEASURE.  

NOTE: When using custom modulation and switching offsets the maximum number of measured values returned is:  
- 13 modulation offsets + 0 Hz carrier  
- 4 switching offsets + 0 Hz carrier

Phase & Frequency Error Measurement

This measures the modulation quality of the transmitter by checking phase and frequency accuracy. You must be in the GSM mode to use these commands. Use INSTRument:SELect to set the mode.

The general functionality of CONFigure, FETCh, MEASure, and READ are described at the beginning of this section. See the SENSe:PFERror commands for more measurement related commands.

Front Panel
Access: Measure, Phase & Freq

After the measurement is selected, press Restore Meas Defaults to restore factory defaults.

<table>
<thead>
<tr>
<th>n</th>
<th>Results Returned</th>
</tr>
</thead>
</table>
| 0    | Returns a series of floating point numbers (in volts) that represent each sample of the complete current time record raw I/Q vector trace length scalar value (giving the total number of I/Q vector sample pairs = n/2). The I/Q vector sample pair data is organized as:  
  I(0), Q(0),  
  I(1), Q(1)  
  ...  
  I([n/2]-1), Q([n/2]-1)  
  The start of bit 0 (zero) of the useful part of the measured GSM burst within the vector sample pairs is located at:  
  I(x/2), Q(x/2)  
  where x = raw I/Q vector trace index to burst. |
<table>
<thead>
<tr>
<th>n</th>
<th>Results Returned</th>
</tr>
</thead>
</table>
| n=1 (or not specified) | Returns the following scalar values:  
1. **RMS phase error** is a floating point number (in degrees) of the rms phase error between the measured phase and the ideal phase. The calculation is based on symbol decision points and points halfway between symbol decision points (i.e. 2 points/symbol). If averaging is on, this is the average of the individual rms phase error measurements.  
2. **Peak phase error** is a floating point number (in degrees) of the peak phase error of all the individual symbol decision points (prior to the rms averaging process). If averaging is on, this is the average of the individual peak phase error measurements.  
3. **Peak phase bit** is a floating point number (in bits) representing the bit number at which the peak phase error occurred. Averaging does not affect this calculation.  
4. **Frequency error** is a floating point number (in Hz) of the frequency error in the measured signal. This is the difference between the measured phase trajectory and the reference phase trajectory. If averaging is on, this is the average of the individual frequency error measurements.  
5. **I/Q offset** is a floating point number (in dB) of the I and Q error (magnitude squared) offset from the origin. If averaging is on, this is the average of the individual IQ Offset measurements.  
6. **Trace phase sample** is a floating point number (in units of bits) representing the time between samples. It is used in querying phase error vector traces.  
7. **Trace bit 0 decision offset** is an integer number in units of sample pairs for the sample points in an I/Q vector trace that represents the bit 0 (zero) decision point. The sample pairs in the trace are numbered 0 to N.  
8. **Trace sync start** is an integer number in units of bits for the bit number, within the data bits trace, that represents the start of the sync word.  
9. **Trace time sample** is a floating point number (in seconds) of the time between samples. It is used in querying time domain traces. For the n=0 trace, of acquired I/Q pairs, this is the time between pairs.  
10. **Phase error trace length** is an integer number (in units of samples) representing the number of samples returned by the current phase error trace and phase error frequency trace.  
11. **RF envelope trace length** is an integer number (in units of samples) representing the number of samples returned by the current RF envelope trace.  
12. **RF envelope trace index to burst** is an integer number (in units of samples) representing the trace sample which represents the start of bit 0 (zero) decision point of the useful part of the measured GSM burst.

MMEMory Subsystem

The purpose of the MMEMory subsystem is to provide access to mass storage devices such as internal or external disk drives. If mass storage is not specified in the filename, the default mass storage will be used.

NOTE

Refer also to :CALCulate and :TRACe subsystems for more trace and limit line commands.

Agilent ESA analyzers use two types of mass storage devices:

- 3.5 inch disk drive (high density, 1.44 MBytes formatted) designated “A:”
- Part of flash memory and treated as a device designated “C:”

The MMEMory command syntax term <file_name> is a specifier having the form: drive:name.ext, where the following rules apply:

- “drive” is “A:” or “C:”
- “name” is a DOS file name of up to eight characters, letters (A-Z, a-z) and numbers (0-9) only (lower case letters are read as uppercase)
- “ext” is an optional file extension using the same rules as “name,” but consists of up to three characters total. (The default file extension will be added if it is not specified.)

Store a Measurement Results in a File

:MMEMory:STORe:RESults filename.csv

Saves the measurement results to a file in memory. The file name must have a file extension of .csv and will be in the CSV (comma-separated values) format.

Example: MMEM:STOR:RES ‘C:mymeas.csv’

Front Panel Access: File, Save, Type, Measurement Results
SENSe Subsystem

These commands are used to set the instrument state parameters so that you can measure a particular input signal. Some SENSe commands are only for use with specific measurements found under the MEASURE key menu or the “MEASure Group of Commands” on page 258. The measurement must be active before you can use these commands.
Cable Fault Location Measurement

Commands for querying the cable fault location measurement results and for setting to the default values are found in the MEASure group of commands. The equivalent front panel keys for the parameters described in the following commands, are found under the Meas Setup key, after the Cable Fault measurement has been selected from the MEASURE key menu.

Cable Fault Location—Average Count

`[:SENSe]:CFLocation:AVERage:COUNt <integer>`

`[:SENSe]:CFLocation:AVERage:COUNt?`

Set the number of sweeps that will be averaged. After the specified number of sweeps (average counts) have been averaged, the averaging termination setting determines the averaging action.

Factory Preset: 10

Range: 1 to 1,000

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELe ct to set the mode.

Cable Fault Location—Averaging State

`[:SENSe]:CFLocation:AVERage[:STATe] OFF|ON|0|1`

`[:SENSe]:CFLocation:AVERage:STATe?`

Turn cable fault location averaging on or off.

Factory Preset: ON

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELe ct to set the mode.

Cable Fault Location—Averaging Termination Control

`[:SENSe]:CFLocation:AVERage:TCONtrol EXPonential|REPeat`

`[:SENSe]:CFLocation:AVERage:TCONtrol?`

Select the type of termination control used for averaging. This determines the averaging action after the specified number of frames (average count) is reached.

EXPonential - After the average count has been reached, each successive data acquisition is exponentially weighted and combined with the existing average.

REPeat - After reaching the average count, the averaging is reset
and a new average is started.

Factory Preset: EXPonential

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

### Cable Fault Location—Resolution Bandwidth

\[
[:\text{SENSe}]:\text{CFLocation}:\text{BANDwidth}[:\text{BWIDth}:\text{RESolution}] <\text{freq}>
\]

\[
[:\text{SENSe}]:\text{CFLocation}:\text{BANDwidth}[:\text{BWIDth}:\text{RESolution}]?
\]

Set the resolution BW. This is an advanced control that normally does not need to be changed. Setting this to a value other than the factory default may cause invalid measurement results.

Factory Preset: 3 MHz

Default Unit: Hz

Range: 1 kHz to 5 MHz

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

### Cable Fault Location—Resolution Bandwidth Coupling Mode

\[
[:\text{SENSe}]:\text{CFLocation}:\text{BANDwidth}[:\text{BWIDth}[:\text{RESolution}]:\text{RAUTo}} \text{OFF|ON|0|1}
\]

\[
[:\text{SENSe}]:\text{CFLocation}:\text{BANDwidth}[:\text{BWIDth}[:\text{RESolution}]:\text{RAUTo}}?
\]

Specify the resolution bandwidth (OFF or 0) or couple the resolution bandwidth to the frequency span (ON or 1).

Factory Preset: RAUTo

Range: On/Off/1/0

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

### Cable Fault Location—Video Bandwidth

\[
[:\text{SENSe}]:\text{CFLocation}:\text{BANDwidth}[:\text{BWIDth}:\text{VIDeo}] <\text{freq}>
\]

\[
[:\text{SENSe}]:\text{CFLocation}:\text{BANDwidth}[:\text{BWIDth}:\text{VIDeo}]?
\]

Specifies the video bandwidth.

Factory Preset: 3 MHz

Range: 1 kHz to 5 MHz
Default Unit: Hz
Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELection to set the mode.

Cable Fault Location—Video Bandwidth Coupling Mode

[:SENSe]:CFLocation: BANDwidth|BWIDth:VIDeo:VAUTo OFF|ON|0|1
[:SENSe]:CFLocation: BANDwidth|BWIDth:VIDeo:VAUTo?
Couples the video bandwidth to the resolution bandwidth.
Factory Preset: ON or 1
Range: OFF/ON/0/1
Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELection to set the mode.

Cable Fault Location—Calibrate

[:SENSe]:CFLocation: CALibrate
Calibrate for the measurement.
Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELection to set the mode.

Cable Fault Location—Cable Loss Per Meter

[:SENSe]:CFLocation: CLOSs <cable loss dB>
[:SENSe]:CFLocation: CLOSs?
Specify the known loss per meter for the cable to be measured.
Factory Preset: 0 dB
Range: 0 to 5 dB
Default Unit: dB
Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELection to set the mode.

Cable Fault Location—FFT Window

[:SENSe]:CFLocation: FFT:WINDow
RECTangular|FTOP|GAUSsian|HANNing
[:SENSe]:CFLocation: FFT:WINDow?
Programming Commands
SENSe Subsystem

Specify the type of windowing function to apply when performing the FFT.

Factory Preset: FTOP

Range: RECT/FTOP/GAUS/HANN

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Cable Fault Location—Center Frequency

[:SENSe]:CFLocation:FREQuency:CENTer <freq>
[:SENSe]:CFLocation:FREQuency:CENTer?

Set the center frequency.

Default Unit: Hz

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Cable Fault Location—Frequency Span

[:SENSe]:CFLocation:FREQuency:SPAN <freq>
[:SENSe]:CFLocation:FREQuency:SPAN?

Set the frequency span.

Default Unit: Hz

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Cable Fault Location—Start Frequency

[:SENSe]:CFLocation:FREQuency:STARt <freq>
[:SENSe]:CFLocation:FREQuency:STARt?

Set the start frequency.

Factory Preset: 3 MHz

Default Unit: Hz

Range: ESA model dependent.

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.
Cable Fault Location—Stop Frequency

[:SENSe]:CFLocation:FREQuency:STOP <freq>
[:SENSe]:CFLocation:FREQuency:STOP?

Set the stop frequency.

Factory Preset:  3 MHz
Default Unit:  Hz
Range:  ESA model dependent.
Remarks:  You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Cable Fault Location—Number of Trace Points

[:SENSe]:CFLocation:POINts <number of points>
[:SENSe]:CFLocation:POINts?

Specify the number of trace points per sweep. Higher numbers of points result in greater accuracy, but the measurements take longer to be performed.

Factory Preset:  512
Range:  Minimum: 128
        Maximum: 8192
Remarks:  You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.
Measurements will be performed faster if you select a number which is a power of 2, for example 256, 512 or 1024.

Cable Fault Location—Trace Points

[:SENSe]:CFLocation:POINts:AUTO AUTO|MANual|1|0
[:SENSe]:CFLocation:POINts:AUTO?

Select auto or manual control of the number of trace points used in the measurement.

Factory Preset:  AUTO
Remarks:  You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.
In AUTO mode, the number of points used is determined by a combination of factors such as range,
resolution and measurement speed. In MANual mode, the minimum and maximum distances change depending on the number of trace points you have entered.

Cable Fault Location—Measured Range

[:SENSe]:CFLocation:RANGE <distance>
[:SENSe]:CFLocation:RANGE?

Specify the range in meters to be measured. This is usually slightly more than the DUT length.

Factory Preset: 20 m

Range: Minimum: (trace pts/2)(speed of light x velocity factor)/2 x max span
       Maximum: (trace pts/2)(speed of light x velocity factor)/2 x 100kHz.

Default Unit: meters

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Cable Fault Location—Measured Offset

[:SENSe]:CFLocation:RANGE:OFFSet <distance>
[:SENSe]:CFLocation:RANGE:OFFSet?

Specify the start position, measured in meters from the beginning of the DUT.

Factory Preset: 0 m

Range: Minimum: 0 meters
       Maximum: Must be less than the range specified in SENSe:CFLocation:RANGe command (above)

Default Unit: meters

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Cable Fault Location—TG Amplitude

[:SENSe]:CFLocation:SOURce:POWer <dBm power>
[:SENSe]:CFLocation:SOURce:POWer?

Set the tracking generator source power.
Factory Preset: –10 dBm
Range: –66 to +3 dBm
Default Unit: dBm
Remarks: You must be in GSM, EDGE mode to use this command.
Use INStrument:SELect to set the mode.

Cable Fault Location—Velocity Factor
[:SENSe]:CFLocation:VFACtor <velocity factor>
[:SENSe]:CFLocation:VFACtor?
Specify the speed a signal can travel through the cable as a factor of the speed of light in a vacuum (3 ¥ 10E8).
Factory Preset: 0.71
Range: 0 to 1
Remarks: You must be in GSM, EDGE mode to use this command.
Use INStrument:SELect to set the mode.
Channel Commands

Select the ARFCN—Absolute RF Channel Number

[:SENSe]:CHANnel:ARFCn <integer>

[:SENSe]:CHANnel:ARFCn?

Set the analyzer to a frequency that corresponds to the ARFCN (Absolute RF Channel Number).

Factory Preset: 38

Range:

0 to 124, and 975 to 1023 for E-GSM
1 to 124 for P-GSM
0 to 124, and 955 to 1023 for R-GSM
512 to 885 for DCS1800
512 to 810 for PCS1900
259 to 293 for GSM450
306 to 340 for GSM480
438 to 511 for GSM700
128 to 251 for GSM850

Remarks:

You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

Global to the current mode.

Front Panel Access: FREQUENCY Channel, ARFCN
Programming Commands
SENSe Subsystem

Channel Burst Type

[:SENSe]:CHANnel:BURSt NORMal|SYNC|ACCess
[:SENSe]:CHANnel:BURSt?

Set the burst type that the analyzer will search for and to which it will sync. This only applies with normal burst selected.

NORMal: Traffic Channel (TCH) and Control Channel (CCH)
SYNC: Synchronization Channel (SCH)
ACCess: Random Access Channel (RACH)

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELeCt to set the mode.
Global to the current mode.

Front Panel
Access: FREQUENCY Channel, Burst Type

Auto ARFCN

[:SENSe]:CHANnel:LOCate

Locate the strongest signal in the current band and update ARFCN accordingly. If there is no signal in the current band, other bands will be searched until a signal is detected

Remarks: Global to the current mode.
You must be in GSM, EDGE mode to use this command. Use INSTrument:SELeCt to set the mode.
This command cannot be queried.

Front Panel
Access: FREQUENCY Channel, Auto ARFCN

DCS/PCS Overlap Priority

[:SENSe]:CHANnel:PREFerences DCS|PCS
[:SENSe]:CHANnel:PREFerences?

Select a priority band when entering an ARFCN that is common to more than one band.

Factory Preset: DCS

Remarks: Global to the current mode.
You must be in GSM, EDGE mode to use this command. Use INSTrument:SELeCt to set the mode.
Programming Commands
SENSe Subsystem

Front Panel
Access: Mode Setup, Radio, DCS/PCS Overlap Priority

Reference Burst Type

[:SENSe]:CHANnel:RBURst NORMal|SYNC|ACCESS
[:SENSe]:CHANnel:RBURst?

Select the type of burst to be used as the reference burst.

Factory Preset: NORMal

Remarks: Global to the current mode.
You must be in GSM, EDGE mode to use this command.
Use INSTrument:SELect to set the mode.

Reference Training Sequence Code

[:SENSe]:CHANnel:RTSCode <integer>
[:SENSe]:CHANnel:RTSCode?

Set the reference training sequence code to search for, with normal burst selected and RTSC auto set to off.

Factory Preset: 0

Range: 0 to 7

Remarks: Global to the current mode.
You must be in GSM, EDGE mode to use this command.
Use INSTrument:SELect to set the mode.

Reference Training Sequence Code Auto

[:SENSe]:CHANnel:RTSCode:AUTO OFF|ON|0|1
[:SENSe]:CHANnel:RTSCode:AUTO?

Select auto or manual control for reference training sequence code (RTSC) search. With auto on, the measurement is made on the first burst found to have one of the valid TSCs in the range 0 to 7 (i.e. normal bursts only). With auto off, the measurement is made on the 1st burst found to have the selected TSC.
Factory Preset: AUTO
Remarks: Global to the current mode.
You must be in GSM, EDGE mode to use this command.
Use INSTrument:SELection to set the mode.

Front Panel
Access: TIMESLOT, Ref TSC (Std)

**Frequency Hopping**

[:SENSe]:CHANnel:SFHopping OFF | ON | 0 | 1
[:SENSe]:CHANnel:SFHopping?
Set the signal’s frequency hopping repetition factor on or off.

Factory Preset: OFF
Remarks: Global to the current mode.
You must be in GSM, EDGE mode to use this command.
Use INSTrument:SELection to set the mode.

Front Panel
Access: Mode Setup, Radio, Frequency Hopping Repetition Factor

**Frequency Hopping Repetition Factor**

[:SENSe]:CHANnel:SFHRepeat <integer>
[:SENSe]:CHANnel:SFHRepeat?
Set the frequency hopping repetition factor.

Factory Preset: 3
Range: 1 to 100
Remarks: Global to the current mode.
You must be in GSM, EDGE mode to use this command.
Use INSTrument:SELection to set the mode.

Front Panel
Access: Mode Setup, Radio, Frequency Hopping Repetition Factor

**Time Slot number**

[:SENSe]:CHANnel:SLOT <integer>
[:SENSe]:CHANnel:SLOT?

Select the slot number that you want to measure.

in GSM, EDGE mode the measurement frame is divided into the eight expected measurement timeslots.

Factory Preset: 0

Range: 0 to 7

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel Access:
Frequency Channel, Timeslot, Timeslot

**Time Slot Auto**

`[:SENSe]:CHANnel:SLOT:AUTO OFF|ON|0|1`

`[:SENSe]:CHANnel:SLOT:AUTO?`

Select auto or manual control for slot searching. The feature is only supported in external and frame trigger source modes. In external trigger mode when timeslot is set on, the demodulation measurement is made on the nth timeslot specified by the external trigger point + n timeslots, where n is the selected timeslot value 0 to 7. In frame trigger mode when timeslot is set on, then demodulation measurement is only made on the nth timeslot specified by bit 0 of frame reference burst + n timeslots, where n is the selected timeslot value 0 to 7 and where the frame reference burst is specified by Ref Burst and Ref TSC (Std) combination.

Factory Preset: OFF, for GSM mode

Remarks: You must be in GSM, EDGE, NADC, or PDC mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel Access:
Frequency Channel, Timeslot, Timeslot

**Training Sequence Code (TSC)**

`[:SENSe]:CHANnel:TSCode <integer>`

`[:SENSe]:CHANnel:TSCode?`

Set the training sequence code to search for, with normal burst selected and TSC auto set to off.

Factory Preset: 0

Range: 0 to 7
Remarks: Global to the current mode.

You must be in the GSM mode to use this command.
Use INSTrument:SELection to set the mode.

Front Panel
Access: FREQUENCY Channel, TSC (Std)

Training Sequence Code (TSC) Auto

[:SENSe]:CHANnel:TSCode:AUTO OFF|ON|0|1
[:SENSe]:CHANnel:TSCode:AUTO?

Select auto or manual control for training sequence code (TSC) search. With auto on, the measurement is made on the first burst found to have one of the valid TSCs in the range 0 to 7 (i.e. normal bursts only). With auto off, the measurement is made on the 1st burst found to have the selected TSC.

Factory Preset: AUTO

Remarks: Global to the current mode.

You must be in the GSM mode to use this command.
Use INSTrument:SELection to set the mode.

Front Panel
Access: FREQUENCY Channel, TSC (Std)
Signal Corrections Commands

Correction For BTS RF Port External Gain

\[:\text{SENSe}\]:\text{CORRection}:\text{BTS}:\text{GAIN} \text{ <rel_power>} \\
[:\text{SENSe}\]:\text{CORRection}:\text{BTS}:\text{GAIN}?

Set equal to the external gain used when measuring base transmit stations. This is only used in ‘Receive Band’ measurements.

Factory Preset: 0 dB  
Range: 0 to 81.9 dB  
Default Unit: dB  
Remarks:  
You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

Front Panel Access:  
Mode Setup, Input....

or

Input, Ext Gain, Base Gain

Correction For BTS RF Port External Attenuation

\[:\text{SENSe}\]:\text{CORRection}:\text{BTS}:\text{LOSS} \text{ <rel_power>} \\
[:\text{SENSe}\]:\text{CORRection}:\text{BTS}:\text{LOSS}?

Set equal to the external attenuation used when measuring base transmit stations. This is only used in ‘Transmit Band’ measurements.

Factory Preset: 0 dB  
Range: 0 to 81.9 dB  
Default Unit: dB  
Remarks:  
You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

Front Panel Access:  
Mode Setup, Input....

or

Input, Ext Atten, Base Atten
Correction For MS RF Port External Gain

GSM Mode

[:SENSe]:CORRection:MS:GAIN <rel_power>

[:SENSe]:CORRection:MS:GAIN?

Set equal to the gain of an external amplifier used when measuring mobile stations.

Factory Preset: 0 dB

Range: 0 to 81.9 dB for GSM

Default Unit: dB

Remarks: Global to the current mode.

You must be in GSM, EDGE or cdmaOne mode to use this command. Use INSTRument:SELect to set the mode.

For GSM.EDGE the Gain setting is applied only in the following measurements:

- Rx Spurious (RXSpur)
- Monitor/Band Channel (MONitor) - when Methos = Band AND Band = Rx

Front Panel Access: For GSM: Mode Setup, Input....

or Input, Ext Gain, Mobile Gain
Correction For MS RF Port External Attenuation

[:SENSe]:CORRection:MS:LOSS <rel_power>
[:SENSe]:CORRection:MS:LOSS?

Set equal to the external attenuation used when measuring mobile stations. This is only used for ‘Transmit Band’ measurements.

Factory Preset: 0 dB
Range: 0 to 81.9 dB
Default Unit: dB
Remarks: Global to the current mode.
You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel Access: Mode Setup, Input....

or

Input, Ext Atten, Mobile Atten
Default Reset

[:SENSe]:DEFaults

Restores personality Mode Setup defaults.

Front Panel
Access: Mode Setup

Remarks: This command sets all the SENSE defaults but has no effect on the MEASURE default settings. Use the CONFigure:<measurement> command to set measurement defaults.
EDGE Error Vector Magnitude Measurement

Commands for querying the EDGE error vector magnitude measurement results and for setting to the default values are found in the “MEASure Group of Commands” on page 258. The equivalent front panel keys for the parameters described in the following commands, are found under the Meas Setup key, after the measurement has been selected from the MEASURE key menu.

History
EEVM measurement was added in the GSM,EDGE personality version C.01.00.

EDGE Error Vector Magnitude—Average Count

[:SENSe]:EEVM:AVERage:COUNt <integer>
[:SENSe]:EEVM:AVERage:COUNt?

Sets the number of data acquisitions that will be averaged. After the specified number of average counts, the average mode (termination control) setting determines the average action.

Factory Preset: 10
Range: 1 to 1000
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

EDGE Error Vector Magnitude—Averaging State

[:SENSe]:EEVM:AVERage[:STATe] OFF|ON|0|1
[:SENSe]:EEVM:AVERage[:STATe]?

Turn average on or off.

Factory Preset: OFF
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

EDGE Error Vector Magnitude—Averaging Termination Control

[:SENSe]:EEVM:AVERage:TCONtrol EXPonential|REPeat
[:SENSe]:EEVM:AVERage:TCONtrol?

Select the type of termination control used for the averaging function. This determines the averaging action after the specified number of data acquisitions (average count) is reached.
EXponential - After the average count has been reached, each successive data acquisition is exponentially weighted and combined with the existing average.

REPeat – After reaching the average count, the averaging is reset and a new average is started.

Factory Preset: EXponential

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

EDGE Error Vector Magnitude—Burst Synchronization Source

Query only for ESA:

[:SENSe]:EEVM:BSYNc:SOURce?

Select the method of synchronizing the measurement to the bursts.

RFBurst – The burst synchronization approximates the start and stop of the useful part of the burst without demodulation of the burst. This type of synchronization has a frequency lock range of up to 9 kHz and allows you to demodulate RF bursts that do not have a training sequence.

Training Sequence (TSEQuence) – The burst synchronization performs a demodulation of the burst and determines the start and stop of the useful part of the burst based on the midamble training sync sequence. This type of synchronization provides better noise immunity but has a smaller frequency lock range (~200 Hz).

None – The measurement is performed without searching burst.

Factory Preset: TSEQuence

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Remarks: On ESA Series analyzers, only Training Sequence (TSEQuence) is supported. The query command will always return TSEQuence as the result.

EDGE Error Vector Magnitude—Droop Compensation

[:SENSe]:EEVM:DROop OFF | ON | 0 | 1

[:,:SENSe]:EEVM:DROop?

Turn droop compensation on or off. Droop compensation corrects amplitude variations across a burst. You may want to turn off this compensation so you can see the changes in the measured magnitude error. Droop can result from signal impairments such as a power
amplifier problem.
Factory Preset: ON
Range: OFF, ON
Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELeCt to set the mode.

EDGE Error Vector Magnitude—Symbol Dots (Quad View)

[:SENSe]:EEVM:GSDots [:STATe] OFF | ON | 0 | 1
[:SENSe]:EEVM:GSDots [:STATe]?
Activates or deactivates points/symbol dot display in quad view.
Factory Preset: ON
Range: OFF, ON
Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELeCt to set the mode.

EDGE Error Vector Magnitude - Limit Test

[:SENSe]:EEVM:LIMit [:STATe] ON | OFF | 1 | 0
[:SENSe]:EEVM:LIMit [:STATe]?
Turn active limit checking of phase and frequency error results on or off.
Factory Preset: On
Range: On | Off
Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELeCt to set the mode.

EDGE Error Vector Magnitude - Rotation

[:SENSe]:EEVM:ROTation [:STATe] ON | OFF | 1 | 0
[:SENSe]:EEVM:ROTation [:STATe]?
Specifies whether or not rotation is applied to the IQ constellation diagram.
Factory Preset: On
Range: On | Off
Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELeCt to set the mode.
EDGE Error Vector Magnitude—Points/Symbol Dots

[:SENSe]:EEVM:SDOTs [:STATe] OFF | ON | 0 | 1

[:SENSe]:EEVM:SDOTs [:STATe]?

Activates or deactivates points/symbol dot display in polar view.
Factory Preset: ON
Range: OFF, ON
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELeCT to set the mode.

EDGE Error Vector Magnitude—Trigger Source

[:SENSe]:EEVM:TRIGger:SOURce IMMEDIATE | RFBurst | EXTERNAL | FRAME

[:SENSe]:EEVM:TRIGger:SOURce?

Select the trigger source used to control the data acquisitions.
- EXTERNAL 1 – front panel external trigger input
- EXTERNAL 2 – rear panel external trigger input
- EXTERNAL – rear panel external trigger input
- IF – internal IF envelope (video) trigger
- IMMEDIATE – the next data acquisition is immediately taken, capturing the signal asynchronously (also called free run)
- FRAME – internal frame trigger from front panel input
- RFBurst – wideband RF burst envelope trigger that has automatic level control for periodic burst signals

Factory Preset: RFBurst
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELeCT to set the mode.

NOTE
Option B7E: RF Comms Hardware has at least three possible part numbers. Press System, More, Show Hdw to show your instrument’s RF Comms Hardware and view the part number. If the part number is E4401-60087 (the original version), the RF Burst trigger source will not be available with this measurement, and the default will be EXTERNAL.

**EDGE Output RF Spectrum Measurement**

Commands for querying the EDGE output RF spectrum measurement results and for setting to the default values are found in the “MEASure Group of Commands” on page 258. The equivalent front panel keys for the parameters described in the following commands, are found under the Meas Setup key, after the EDGE Output RF Spectrum measurement has been selected from the MEASURE key menu.

History: EORF measurement was added in the GSM,EDGE personality version C.01.00.

**EDGE Output RF Spectrum—Number of Bursts Averaged**

[:SENSe]:EORFspectr:AVERage:COUNt <integer>

[:SENSe]:EORFspectr:AVERage:COUNt?

Set the number of bursts that will be averaged. For the output RF spectrum due to switching transients, it is more accurate to consider this the number of frames that are measured. After the specified number of bursts (average counts), the averaging mode (termination control) setting determines the averaging action.

Factory Preset: 20

Range: 1 to 1000

Remarks: You must be in GSM, EDGE mode to use this command.

Use INSTRument:SELection to set the mode.

**EDGE Output RF Spectrum—Averaging Control**

[:SENSe]:EORFspectr:AVERage[:STATe] OFF|ON|0|1

[:SENSe]:EORFspectr:AVERage[:STATe]?

Turn averaging on or off.

Factory Preset: OFF

Remarks: You must be in GSM, EDGE mode to use this command.

Use INSTRument:SELection to set the mode.

**EDGE Output RF Spectrum—Averaging Termination**

[:SENSe]:EORFspectr:AVERage:TCONtrol EXPonential|REPeat

[:SENSe]:EORFspectr:AVERage:TCONtrol?

Select the type of termination control used for the averaging function. This determines the averaging action after the specified number of
frames (average count) is reached.

EXPonential - After the average count is reached, each successive data acquisition is exponentially weighted and combined with the existing average.

REPeat - After reaching the average count, the averaging is reset and a new average is started.

Factory Preset: REPeat

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

**EDGE Output RF Spectrum—Resolution BW For Modulation At Close Offsets**

[:SENSe]:EORFspectr:BANDwidth[:RESolution]:MODulation:OFFSet:CLOSe <freq>

[:SENSe]:EORFspectr:BANDwidth[:RESolution]:MODulation:OFFSet:CLOSe?

Set the resolution bandwidth used for the spectrum due to modulation part of the EORF measurement for offset frequencies less than 1800 kHz.

This parameter is only used with the Standard or Short lists, and not with the Custom list.

Factory Preset: 30 kHz
Range: 1 kHz to 5 MHz
Default Unit: Hz
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

**EDGE Output RF Spectrum—Resolution BW for Modulation at Far Offsets**

[:SENSe]:EORFspectr:BANDwidth[:RESolution]:MODulation:OFFSet:FAR <freq>

[:SENSe]:EORFspectr:BANDwidth[:RESolution]:MODulation:OFFSet:FAR?

Set the resolution bandwidth used for the spectrum due to modulation part of the EORF measurement for offset frequencies greater than or equal to 1800 kHz.

This parameter is only used with the Standard or Short lists, and not with the Custom list.
SENSe Subsystem

Programming Commands

Factory Preset: 100 kHz
Range: 1 kHz to 5 MHz
Default Unit: Hz
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

EDGE Output RF Spectrum—Resolution BW For Switching Transients At Close Offsets

[SENSe]:EORFspectr:BANDwidth[:RESolution]:SWITching:OFFSet:CLOSE <freq>

[SENSe]:EORFspectr:BANDwidth[:RESolution]:SWITching:OFFSet:CLOSE?

Set the resolution bandwidth used for the spectrum due to switching transients part of the EORF measurement for offset frequencies less than 1800 kHz.

This parameter is only used with the Standard or Short lists, and not with the Custom list.

Factory Preset: 30 kHz
Range: 1 kHz to 5 MHz
Default Unit: Hz
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

EDGE Output RF Spectrum—Resolution BW For Switching Transients At Far Offsets

[SENSe]:EORFspectr:BANDwidth[:RESolution]:SWITching:OFFSet: FAR <freq>

[SENSe]:EORFspectr:BANDwidth[:RESolution]:SWITching:OFFSet: FAR?

Set the resolution bandwidth used for the spectrum due to switching transients part of the EORF measurement for offset frequencies greater than or equal to 1800 kHz.

This parameter is only used with the standard or short lists, and not with the custom list.

Factory Preset: 30 kHz
100 kHz
Range: 1 kHz to 5 MHz
Default Unit: Hz
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

**EDGE Output RF Spectrum—Video BW For Switching Transients At Close Offsets**

`[:SENSe]:EORFspectr:BANDwidth|BWIDth:VIDeo:SWITching:OFFSet :CLOSE <freq>`

`[:SENSe]:EORFspectr:BANDwidth|BWIDth:VIDeo:SWITching:OFFSet :CLOSE?`

Set the video bandwidth used for the spectrum due to switching transients part of the EORF measurement for offset frequencies less than 1800 kHz. (Changing this deviates from the GSM standard settings.)

This parameter is only used with the Standard or Short lists, and not with the Custom list.

Factory Preset: 100 kHz
Range: 30 Hz to 3 MHz
Default Unit: Hz
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

**EDGE Output RF Spectrum—Automatic Video BW For Switching Transients At Close Offsets**

`[:SENSe]:EORFspectr:BANDwidth|BWIDth:VIDeo:SWITching:OFFSet :CLOSE:AUTO OFF|ON |0 |1`

`[:SENSe]:EORFspectr:BANDwidth|BWIDth:VIDeo:SWITching:OFFSet :CLOSE:AUTO?`

Set the video bandwidth to be automatically coupled to the resolution bandwidth. This VBW is used for offset frequencies less than 1800 kHz, for the spectrum due to switching transients part of the EORF measurement.

Factory Preset: On
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.
**EDGE Output RF Spectrum—Video BW For Switching Transients At Far Offsets**

```
[:SENSe]:EORFspectr:BANDwidth|BWIDth:VIDeo:SWITching:OFFSet:FAR <freq>
[:SENSe]:EORFspectr:BANDwidth|BWIDth:VIDeo:SWITching:OFFSet:FAR?
```

Set the video bandwidth used for the spectrum due to switching transients part of the EORF measurement for offset frequencies greater than or equal to 1800 kHz. (Changing this deviates from the GSM standard settings.)

This parameter is only used with the standard or short lists, and not with the custom list.

Factory Preset: 100 kHz

Range: 30 Hz to 3 MHz

Default Unit: Hz

Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

**EDGE Output RF Spectrum—Automatic Video BW For Switching Transients At Far Offsets**

```
[:SENSe]:EORFspectr:BANDwidth|BWIDth:VIDeo:SWITching:OFFSet:FAR:AUTO OFF|ON|0|1
[:SENSe]:EORFspectr:BANDwidth|BWIDth:VIDeo:SWITching:OFFSet:FAR:AUTO?
```

Set the video bandwidth to be automatically coupled to the resolution bandwidth. This VBW is used for offset frequencies greater than or equal to 1800 kHz, for the spectrum due to switching transients part of the EORF measurement.

Factory Preset: On

Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

**EDGE Output RF Spectrum—Burst Synchronization Source**

```
[:SENSe]:EORFspectr:BSYNc:SOURce TSEQuence|RFAMplitude|NONE
[:SENSe]:EORFspectr:BSYNc:SOURce?
```

Select the method of synchronizing the measurement to the bursts.

- Training Sequence (TSEQuence) - the training sequence burst sync
performs a demodulation of the burst and determines the start and stop of the useful part of the burst based on the midamble training sequence.

RFAMplitude - the RF amplitude burst sync approximates the start and stop of the useful part of the burst without digital demodulation of the burst.

NONE - no burst sync is used.

Factory Preset: TSEQuence when options B7E/B7D are present
RFAMplitude without options B7E/B7D

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

**EDGE Output RF Spectrum—Offset Frequency List**

`[:SENSe]:EORFspectr:LIST:SELect SHORT|STANdard`  
`[:SENSe]:EORFspectr:LIST:SELect?`

Select the list of settings that will be used to make the EORF measurement. This specifies standard or customized lists and short lists. The lists contain the offset frequencies (and bandwidths) that are used for the modulation spectrum and transient spectrum parts of the EORF measurement.

CUSTom - uses the four user-defined lists that specify:

— Offset frequencies for modulation spectrum measurement
— Corresponding resolution bandwidths for each of the modulation offset frequencies
— Offset frequencies for switching transient spectrum measurement
— Corresponding resolution bandwidths for each of the switching transient offset frequencies

SHORT - a shortened list of the offset frequencies specified in the EDGE Standards. It uses two internal offset frequency lists, one for modulation spectrum and the other for switching transient spectrum. These offset frequencies cannot be changed, but the resolution bandwidths can be changed by other commands in the SENSe:EORFpectr subsystem.

STANdard - the complete list of the offset frequencies specified in the EDGE Standards, except for those offsets greater than 6 MHz. It uses two internal offset frequency lists, one for modulation spectrum and the other for switching transient spectrum. These offset frequencies cannot be changed, but the resolution bandwidths can be changed by other commands in the SENSe:EORFpectr subsystem.

Factory Preset: SHORT
Remarks: This command is only valid if SENS:EORF:MEAS is set to multiple.

If you change the number of custom offsets then the number of offset bandwidths, frequencies and level offsets must also be changed.

You must be in GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.

**EDGE Output RF Spectrum—Measure Offsets Measurement Method**

[:SENSe]:EORFspectr:MEASure MULTiple|SINGle|SWEPt

[:SENSe]:EORFspectr:MEASure?

Select the measurement method to be used.

MULTiple - the measurement is done at all offsets in the offset frequency list.

SINGle - the measurement is done at only one offset as determined by the offset frequency setting. This allows detailed examination of the time-domain waveform at the specified offset frequency.

SWEPt - sets the trigger source to free run. The previous trigger source selection is restored when measurement mode is returned to SINGle or MULTiple.

Factory Preset: MULTiple

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.

**EDGE Output RF Spectrum—Offset Frequency**

[:SENSe]:EORFspectr:OFRequency <freq>

[:SENSe]:EORFspectr:OFRequency?

Set the offset frequency that is used to measure a single offset. This command is only valid if SENS:EORF:MEAS is set to single.

Factory Preset: 250 kHz

Range: -6.0 MHz to +6.0 MHz

Step Size: Steps through the values in the selected offset frequency list

Default Unit: Hz

Remarks: You must be in GSM, EDGE mode to use this command.
Use INSTrument:SELect to set the mode.

**EDGE Output RF Spectrum—Maximum RF Mixer Power**

[:SENSe]:EORFspectr:POWer:MIXer:RANGe[:UPPer] <real>

[:SENSe]:EORFspectr:POWer:MIXer:RANGe?

Set the attenuation to automatically maintain the specified maximum power level at the RF mixer input.

Factory Preset: 0.00 dBm

Range: -100 to +10 dBm

Remarks: This is an advanced parameter that has been set up for maximum performance. Using settings greater than 0 dBm could result in a compressed signal or spurious signals or both.

You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

**EDGE Output RF Spectrum—Reference Power Average**

[:SENSe]:EORFspectr:REFerence:AVERage:COUNt <integer>

 [:SENSe]:EORFspectr:REFerence:AVERage:COUNt?

Set the number of bursts to be averaged when measuring the reference power. Reference power average state must be set to OFF. Reference power averages is valid only if SENS:EORFS:MEAS is set to single.

Factory Preset: 10

Range: 1 to 1,000

Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

**EDGE Output RF Spectrum—Reference Power Average State**

[:SENSe]:EORFspectr:REFerence:AVERage[:AUTO] OFF | ON | 0 | 1

[:SENSe]:EORFspectr:REFerence:AVERage[:AUTO]?

Specifies how many averages to use when measuring the reference power. Set it to ON to use the same number of averages as specified in the number of bursts averaged command. Set it to OFF to use the number specified in the reference power averages command (for further information refer to the previous command). Reference power average state is valid only if SENS:EORFS:MEAS is set to single.
Programming Commands

SENSe Subsystem

Factory Preset: ON
Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTRument:SELeCt to set the mode.

EDGE Output RF Spectrum—Trigger Source

[:SENSe]:EORFspectr:TRIGger:SOURce EXTernal|FRAMe|RF Burst
[:SENSe]:EORFspectr:TRIGger:SOURce?

Select the trigger source used to control the data acquisitions.

- EXTernal 1 - front panel external trigger input
- EXTernal 2 - rear panel external trigger input
- EXTernal - rear panel external trigger input
- FRAMe - uses the internal frame timer, which has been synchronized to the selected burst sync
- IMMEDIATE - the next data acquisition is immediately taken, capturing the signal asynchronously (also called free run)
- RF Burst - wideband RF burst envelope trigger that has automatic level control for periodic burst signals

Factory Preset: RF burst for ESA with options B7E/B7D

- EXTernal for ESA without options B7E/B7D
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELeCt to set the mode.

NOTE
Option B7E: RF Comms Hardware has at least three possible part numbers. Press System, More, Show Hdwr to show your instrument’s RF Comms Hardware and view the part number. If the part number is E4401-60087 (the original version), the RF Burst trigger source will not be available with this measurement, and the default will be EXTernal.

EDGE Output RF Spectrum—Measurement Type

[:SENSe]:EORFspectr:TYPE MODulation|SWITching
[:SENSe]:EORFspectr:TYPE?

Select the measurement type.

- MODulation - only the modulation spectrum is measured.
- SWITching - only the switching transient spectrum is measured.

Factory Preset: MODulation
Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELeect to set the mode.

**EDGE Output RF Spectrum—Wideband Noise**

`:SENSe]:EORFspectr:WBNoise OFF|ON|0|1`  
`:SENSe]:EORFspectr:WBNoise?`

Set wideband noise function to ON or OFF. When set to OFF, the analyzer is tuned to the carrier and -1800 kHz to +1800 kHz either side of the center frequency is swept. When set to ON, the whole of the relevant band 2 MHz either side is swept.

Factory Preset: OFF

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELeect to set the mode.
EDGE Power vs. Time (Burst Power) Measurement

Commands for querying the power versus time measurement results and for setting to the default values are found in the “MEASure Group of Commands” on page 258. The equivalent front panel keys for the parameters described in the following commands, are found under the Meas Setup key, after the EDGE PvT measurement has been selected from the MEASURE key menu.

History: EPVT measurement was added in the GSM, EDGE personality version C.01.00.

EDGE Power vs. Time—Number of Bursts Averaged

[:SENSe]:EPVTime:AVERage:COUNt <integer>
[:SENSe]:EPVTime:AVERage:COUNt?

Set the number of bursts that will be averaged. After the specified number of bursts (average counts), the averaging mode (termination control) setting determines the averaging action.

Factory Preset: 10
Range: 1 to 1000
Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.

EDGE Power vs. Time—Averaging State

[:SENSe]:EPVTime:AVERage[:STATe] OFF|ON|0|1
[:SENSe]:EPVTime:AVERage[:STATe]?

Turn averaging on or off.

Factory Preset: OFF
Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.

EDGE Power vs. Time—Averaging Termination Control

[:SENSe]:EPVTime:AVERage:TCONtrol EXPonential|REPeat
[:SENSe]:EPVTime:AVERage:TCONtrol?

Select the type of termination control used for the averaging function. This specifies the averaging action after the specified number of bursts (average count) is reached.
EXponential - After the average count has been reached, each successive data acquisition is exponentially weighted and combined with the existing average.

REPeat - After reaching the average count, the averaging is reset and a new average is started.

Factory Preset: EXponential

Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

EDGE Power vs. Time—Averaging Type

[:SENSe]:EPVTime:AVERAGE:TYPE LPOWer|POWer
[:SENSe]:EPVTime:AVERAGE:TYPE?

Select the type of averaging to be performed.

LOG - The log of the power is averaged. (This is also known as video averaging.)

MAXimum - The maximum values are retained.

MINimum - The minimum values are retained.

MXMinimum - Both the maximum and the minimum values are retained.

RMS - The power is averaged, providing the rms of the voltage.

LPOWer - Sums the trace data and divides by the average count.

POWer - Trace data is converted from dB to power units, then averaged. This type is more time consuming.

Factory Preset: POWer for ESA

Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

EDGE Power vs. Time—Resolution BW

[:SENSe]:EPVTime:BWIDth[:RESolution] <freq>
[:SENSe]:EPVTime:BWIDth[:RESolution]?

Set the resolution BW. This is an advanced control that normally does not need to be changed. Setting this to a value other than the factory default, may cause invalid measurement results.

Factory Preset: 300 kHz for ESA

Range: 1 kHz to 5 MHz for ESA without Option 1DR
Programming Commands
SENSe Subsystem

10 Hz to 5 MHz for ESA with Option 1DR
1 Hz to 5 MHz for ESA with Options 1DR and 1D5
Default Unit: Hz
Remarks: You must be in the GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

EDGE Power vs. Time—Video BW
[:SENSe]:EPVTime:BANDwidth|BWIDth:VIDeo <bandwidth>
[:SENSe]:EPVTime:BANDwidth|BWIDth:VIDeo?
Sets the video BW. This is an advanced control that normally does not need to be changed. Setting this to a value other than the factory default, may cause invalid measurement results.
Factory Preset: 300 kHz
Range: 30 Hz to 3 MHz without Option 1DR
1 Hz to 3 MHz with Option 1DR
Default Unit: Hz
Remarks: You must be in the GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

EDGE Power vs. Time—Burst Synchronization Source
[:SENSe]:EPVTime:BSYNc:SOURce TSEQuence|RFAMplitude|NONe
[:SENSe]:EPVTime:BSYNc:SOURce?
Select the method of synchronizing the measurement to the EDGE bursts.

  RFBurst - the RF burst sync approximates the start and stop of the useful part of the burst without digital demodulation of the burst.

  TSEQuence - the training sequence burst sync performs a demodulation of the burst and determines the start and stop of the useful part of the burst based on the midamble training sequence.

  RFAMplitude - synchronizes the measurement to the burst transition of the measured RF carrier.

  NONe - Uses the start of the time record as the start of the useful part of the burst.

Factory Preset: TSEQuence for ESA when options B7E/B7D are present
RFAMplitude for ESA without Options B7E/B7D

Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

**EDGE Power vs. Time—Current Data**

[:SENSe]:EPVTime:CDATa ON|OFF|1|0

[:SENSe]:EPVTime:CDATa?

Use to turn On or Off the current data calculation and display of the Mean Carrier Power, Maximum Point, and Minimum Point values for the current trace. The measurement executes faster when this parameter is set to off.

Factory Preset: ON

Range: On | Off

Remarks: You must be in the GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.
EDGE Power vs. Time—Limit Line Mask Display

[:SENSe]:EPVTime:LIMit:MASK OFF|ON|0|1
[:SENSe]:EPVTime:LIMit:MASK?

Show or hide the limit mask. Does not affect limit pass/fail calculation. Same as :DISPlay:EPVTime:LIMit:MASK.

Factory Preset: ON

Range: ON | OFF

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.

EDGE Power vs. Time—Limit Test

[:SENSe]:EPVTime:LIMit:TEST ON|OFF|1|0
[:SENSe]:EPVTime:LIMit:TEST?

Turns active limit checking On or Off. Measurement results are not checked against test limit requirements when set to Off.

Factory Preset: ON

Range: On | Off

Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.

EDGE Power vs. Time—Lower Mask Absolute Amplitude Levels

[:SENSe]:EPVTime:MASK:LIST:LOWer:ABSolute
<power>, <power>, <power>, <power>, <power>

[:SENSe]:EPVTime:MASK:LIST:LOWer:ABSolute?

Enter a power level for any of your mask line segments that require an absolute minimum power limit in addition to its relative limit. Each time a measurement is made the Ref Level is determined. (This is the power level of the useful part of the burst, or midway between the upper/lower masks). Remember, as the power of the Ref Level changes, all of the relative mask power levels will change by the same amount.

Each relative limit is then compared to the Ref Level and an equivalent absolute power level is calculated. This power level is compared to the specified absolute limit for each line segment. If this calculated relative limit is lower then the absolute limit you’ve specified, then the value of the absolute limit is used for this segment. Therefore, if the absolute limit is set to a very low value (~200 dBm), the calculated value of the reference limit will never be lower, and the specified relative limit will
always be used for that segment. See Figure 4-1 on page 326.

Every time point you defined with PVT:MASK:LOW:TIME must have a power value defined in the same order. You can put a comma in the SCPI command as a place holder for any points where an absolute power is not specified, and that segment will then use the default value.

Factory Preset: Selected EDGE standard
Range: $-200$ dBm to $+100$ dBm
Default Unit: dBm
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

**EDGE Power vs. Time—Lower Mask Points**

\[
[\text{:SENSe}:\text{EPVTime}:\text{MASK}:\text{LIST}:\text{LOWer}:\text{POINts}?]
\]

Query the number of elements in the lower mask. This value is determined by the number of time points entered using \([\text{:SENSe}:\text{EPVTime}:\text{MASK}:\text{LIST}:\text{LOWer}:\text{TIME}].

Range: integer, 1 to 25
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

**EDGE Power vs. Time—Lower Mask Relative Amplitude Levels**

\[
[\text{:SENSe}:\text{EPVTime}:\text{MASK}:\text{LIST}:\text{LOWer}:\text{RELative} \text{,<rel_power>, <rel_power>, <rel_power>, <rel_power>, ...,}]
\]

\[
[\text{:SENSe}:\text{EPVTime}:\text{MASK}:\text{LIST}:\text{LOWer}:\text{RELative}?]
\]

Enter the relative power level for each horizontal line segment in the lower limit mask. There should be a power level for each time point entered using \([\text{:SENSe}:\text{EPVTime}:\text{MASK}:\text{LIST}:\text{LOWer}:\text{TIME}].\), and they must be entered in the same order. These power levels are all relative to the defined Reference Power Level (the average power in the useful part of the data).

Any portion of the signal that has no limit line segment defined for it, will default to a very low limit ($-100$ dB relative to the reference power). This will keep the measurement from indicating a failure for that portion of the data.

Factory Preset: Selected EDGE standard
Range: $+200$ dB to $-100$ dB, relative to the reference power
Default Unit: dB
Programming Commands
SENSe Subsystem

Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

**EDGE Power vs. Time—Lower Mask Time Points**

[:SENSe]:EPVTime:MASK:LIST:LOWer:TIME
<seconds>, <seconds>, <seconds>, <seconds>, ...

[:SENSe]:EPVTime:MASK:LIST:LOWer:TIME?

Enter the time points that define the horizontal line segments of the lower limit. A reference point designated “t₀” is at the center of the useful data (usually the center of the burst). Each line segment to the right of the t₀ reference point is designated as a positive time value and each segment to the left of t₀ is a negative time value.

First enter positive values in sequence starting from t₀, then negative values in sequence starting from t₀. See Figure 4-1 on page 326 and the [:SENSe]:EPVT:MASK:LIST:UPPER:TIME example below it. (This is an upper mask example, but they work the same.)

We recommend that you select a large time value for your first and last mask points (e.g. −1 and +1 second). This guarantees that you've defined a limit for all the measured data. (See Mask Segments 4 and 9 in the Table on page 326 for an example.)

Factory Preset: Selected EDGE standard

Range: −1s to +1s, referenced to t₀ at the center of the useful data (burst center)

1 to 25 time points in a mask

Default Unit: seconds

Remarks: You must be in the GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

**EDGE Power vs. Time—Upper Mask Absolute Amplitude Levels**

[:SENSe]:EPVTime:MASK:LIST:UPPer:ABSolute
<power>, <power>, <power>, <power>, ...

[:SENSe]:EPVTime:MASK:LIST:UPPer:ABSolute?

Enter a power level for any of your mask line segments that require an absolute minimum power limit in addition to its relative limit. Each time a measurement is made the Ref Level is determined. (This is the power level of the useful part of the burst, or midway between the upper/lower masks). Remember, as the power of the Ref Level changes, all of the relative mask power levels will change by the same amount.
Each relative limit is then compared to the Ref Level and an equivalent absolute power level is calculated. This power level is compared to the specified absolute limit for each line segment. If this calculated relative limit is lower then the absolute limit you’ve specified, then the value of the absolute limit is used for this segment. Therefore, if the absolute limit is set to a very low value (−200 dBm), the calculated value of the reference limit will never be lower, and the specified relative limit will always be used for that segment. See Figure 4-1 on page 326.

Every time point you defined with PVT:MASK:LOW:TIME must have a power value defined in the same order. You can put a comma in the SCPI command as a place holder for any points where an absolute power is not specified, and that segment will then use the default value.

Factory Preset: Selected EDGE standard
Range: −200 dBm to +100 dBm
Default Unit: dBm
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

EDGE Power vs. Time—Upper Mask Points
[:SENSe]:EPVTime:MASK:LIST:UPPer:POINts?
Query the number of elements in the upper mask. This value is determined by the number of time points entered using [:SENSe]:EPVTime:MASK:LIST:UPPer:TIME.
Range: integer, 1 to 25
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

EDGE Power vs. Time—Upper Mask Relative Amplitude Levels
[:SENSe]:EPVTime:MASK:LIST:UPPer:RELative <rel_power>, <rel_power>, <rel_power>, <rel_power>, <rel_power>
[:SENSe]:EPVTime:MASK:LIST:UPPer:RELative?
Enter the relative power level for each horizontal line segment in the upper limit mask. There should be a power level for each time point entered using [:SENSe]:EPVTime:MASK:LIST:UPPer:TIME, and they must be entered in the same order. These power levels are all relative to the defined Reference Power Level (the average power in the useful
part of the data). See Figure 4-1 on page 326.

</table>

<sup>a</sup> Notice that this segment, with this value of Ref Level, has a calculated relative level of -60 dBm. This is lower than the specified absolute level of -58 dBm, so the -58 dBm value will be used as the test limit for the segment.
Example:  \texttt{EPVT:MASK:LIST:UPP:REL 4, -32, -48, 100, 4, 7, -25, -43, 100}

Factory Preset:  Selected EDGE standard

Range:  200 dB to \(-100\) dB, relative to the reference power

Default Unit:  dB

Remarks:  You must be in GSM, EDGE mode to use this command. Use \texttt{INSTRument:SELect} to set the mode.

\textbf{EDGE Power vs. Time—Upper Mask Time Points}

\begin{verbatim}
[:SENSe]:EPVTime:MASK:LIST:UPPer:TIME <seconds>, <seconds>, <seconds>, <seconds>, <seconds>, ... 
[:SENSe]:EPVTime:MASK:LIST:UPPer:TIME?
\end{verbatim}

Enter the time points that define the horizontal line segments of the upper limit. A reference point designated “\(t_0\)” is at the center of the useful data (usually the center of the burst). Each line segment to the right of the \(t_0\) reference point is designated as a positive value and each segment to the left of \(t_0\) is a negative value.

First enter positive values in sequence starting from \(t_0\), then the negative values in sequence starting from \(t_0\). See Figure 4-1 on page 326 and the \texttt{EPVT:MASK:LIST:UPPER:TIME} example below it.

We recommend that you select a large time value for your first and last mask points (e.g. \(-1\) and \(+1\) second). This guarantees that you’ve defined a limit for all the measured data. (See Mask Segments 4 and 9 in the Table on page 326 for an example.

Example:  \texttt{EPVT:MASK:LIST:UPP:TIME 280e-6, 15e-6, 1, -270e-6, -10e-6, -20e-6, -1}

Factory Preset:  Selected EDGE standard

Range:  \(-1\)s to \(+1\)s, referenced to \(t_0\) at the center of the useful data (burst center)

\begin{itemize}
  \item 1 to 25 time points in a mask
\end{itemize}

Default Unit:  seconds

Remarks:  You must be in the GSM, EDGE mode to use this command. Use \texttt{INSTRument:SELect} to set the mode.

\textbf{EDGE Power vs. Time—Mask Offset}

\begin{verbatim}
[:SENSe]:EPVTime:MASK:OFFSet <rel_ampl>
\end{verbatim}
[:SENSe]:EPVTime:MASK:OFFSet?

Specify the amount of amplitude offset to use when calculating the relative portions of the limit mask. This value is used in conjunction with Mask Reference Power to determine where to position the limits mask. This value does not affect any areas of the limit mask that are absolute (dBm).

Factory Preset: 0.00 dB

Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

EDGE Power vs. Time—Mask Reference Power

[:SENSe]:EPVTime:MASK:REFERENCE TSC|DEMOD

[:SENSe]:EPVTime:MASK:REFERENCE?

Select how the limit mask reference power is measured—over the TSC part of the burst, or the Demod part of the burst. This value is used in conjunction with the Mask Offset value to determine where to position the limits mask.

Factory Preset: TSC

Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

EDGE Power vs. Time—Custom Limit Masks

[:SENSe]:EPVTime:MASK:SELeCT STANdard|CUSTOM

[:SENSe]:EPVTime:MASK:SELeCT?

Select standard masks or user-defined custom masks against which to compare your measured data.

Factory Preset: STANdard

Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.
EDGE Power vs. Time—Max Hold

[:SENSe]:EPVTime:MAXHold[:STATe] ON|OFF|1|0
[:SENSe]:EPVTime:MAXHold?

Set to On to display and hold the maximum responses of a signal.

Factory Preset: OFF
Range: On | Off
Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

EDGE Power vs. Time—Measurement Timeslots

[:SENSe]:EPVTime:MTIMe <integer>
[:SENSe]:EPVTime:MTIMe?

Set the number of timeslots to show on screen with each measurement cycle.

Factory Preset: 1
Range: 1 to 8
Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

EDGE Power vs Time - Select Power Control Level

Allows user to indicate the output power of the transmitter; in MS testing transmitter output power level will affect the mask. The appropriate power level for measuring the device under test will correspond with the transmitter power control level setting.

[:SENSe]:EPVTime:PCLevel <integer>
[:SENSe]:EPVTime:PCLevel?

Range: 0 to 40
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode

Front Panel Access: Meas Setup, More (1 of 2), Pwr Cntrl Lvl.
Programming Commands
SENSe Subsystem

EDGE Power vs. Time—Trace Points

[:SENSe]:EPVTime:POINts TP401|TP801|TP1601|TP3201|TP6401
[:SENSe]:EPVTime:POINts?

Set the number of trace points used in the measurement. More trace points will improve measurement accuracy, but slower measurement speed. TP3201 is recommended with Rise & Fall view.

Factory Preset: TP1601
Range: TP401 | TP801 | TP1601 | TP3201 | TP6401
Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.

EDGE Power vs. Time—Trigger Source

[:SENSe]:EPVTime:TRIGger:SOURce |RFBurst|EXTer nal|FRA Me
[:SENSe]:EPVTime:TRIGger:SOURce?

Select the trigger source used to control the data acquisitions.

- EXTernal 1 - front panel external trigger input
- EXTernal 2 - rear panel external trigger input
- FRAMe - uses the internal frame timer, which has been synchronized to the selected burst sync.
- IF - internal IF envelope (video) trigger
- IMMEDIATE - the next data acquisition is immediately taken, capturing the signal asynchronously (also called Free Run).
- RFBurst - wideband RF burst envelope trigger that has automatic level control for periodic burst signals.
- EXTernal - rear panel external trigger input

Factory Preset: RFBurst for ESA when options B7E/B7D are present
EXTer nal for ESA without Options B7E/B7D
Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.

NOTE
Option B7E: RF Comms Hardware has at least three possible part numbers. Press System, More, Show Hdw r to show your instrument’s RF Comms Hardware and view the part number. If the part number is E4401-60087 (the original version), the RF Burst trigger source will not be available with this measurement, and the default will be EXTernal.
Frequency Commands

Center Frequency

[:SENSe]:FREQuency:CENTer <freq>
[:SENSe]:FREQuency:CENTer?

Set the center frequency.

Factory Preset: ESA E4401B, E4411B: 750 MHz for SA
ESA E4402B, E4403B: 1.5 GHz for SA
ESA E4404B: 3.35 GHz for SA
ESA E4405B: 6.6 GHz for SA
ESA E4407B, E4408B: 13.25 GHz for SA
942.6 MHz for GSM
The first channel in the current tuning plan, for cdmaOne.
2.40200 GHz for Bluetooth

Range: ESA E4401B, E4411B: –80 MHz to 1.58 GHz for SA
ESA E4402B, E4403B: –80 MHz to 3.1 GHz for SA
ESA E4404B: –80 MHz to 6.78 GHz for SA
ESA E4405B: –80 MHz to 13.3 GHz for SA
ESA E4407B, E4408B: –80 MHz to 27.0 GHz for SA
942.6 MHz for GSM
The same as the SA range for cdmaOne
2.400 to 2.4835 GHz for Bluetooth

Default Unit: Hz

Remarks: Global to the current mode.

Front Panel Access: For ESA SA, GSM, and Bluetooth
FREQUENCY/Channel, Center Freq
For ESA cdmaOne
FREQUENCY/Channel, Channel Freq
Frequency Span

[:SENSe]:FREQuency:SPAN <freq>
[:SENSe]:FREQuency:SPAN?

Set the frequency span. Setting the span to 0 Hz puts the analyzer into zero span. If resolution bandwidth is set to a value less than 1 kHz, maximum span is limited to 5 MHz.

Factory Preset: ESA E4401B, E4411B: 1.5 GHz
            ESA E4402B, E4403B: 3.0 GHz
            ESA E4404B: 6.7 GHz
            ESA E4405B: 13.2 GHz
            ESA E4407B, E4408B: 26.5 GHz

Range: ESA E4401B, E4411B: 100 Hz to 1.58 GHz
       ESA E4402B, E4403B: 100 Hz to 3.10 GHz
       ESA E4404B: 100 Hz to 6.78 GHz
       ESA E4405B: 100 Hz to 13.3 GHz
       ESA E4407B, E4408B: 100 Hz to 27.0 GHz

Default Unit: Hz

Front Panel
Access: SPAN/X Scale, Span
        or SPAN/X Scale, Zero Span

Full Frequency Span

[:SENSe]:FREQuency:SPAN:FULL

Set the frequency span to full scale. If resolution bandwidth is set to a value less than 1 kHz, maximum span is limited to 5 MHz.

Factory Preset: ESA E4401B, E4411B: 1.5 GHz
                ESA E4402B, E4403B: 3.0 GHz
                ESA E4404B: 6.7 GHz
                ESA E4405B: 13.2 GHz
                ESA E4407B, E4408B: 26.5 GHz

Front Panel
Access: SPAN/X Scale, Full Span
Monitor Spectrum or Monitor Band/Channel Measurement

Commands for querying the monitor spectrum or monitor band/channel measurement results and for setting to the default values are found in the “MEASure Group of Commands” on page 258. The equivalent front panel keys for the parameters described in the following commands, are found under the Meas Setup key, after the Monitor Spectrum or Monitor Band/Channel measurement has been selected from the MEASURE key menu.

Monitor Spectrum or Monitor Band/Channel—Average Count

[:SENSe]:MONitor:AVERage:COUNt <integer>
[:SENSe]:MONitor:AVERage:COUNt?

Set the number of data acquisitions that will be averaged. After the specified number of average counts, the averaging mode (termination control) setting determines the averaging action.

Factory Preset: 10

Range: 1 to 1,000

Remarks: You must be in the Bluetooth, cdmaOne, GSM, Modulation Analysis, Noise Figure or Phase Noise mode to use this command. Use INSTrument:SELection to set the mode.

Front Panel Access: Meas Setup, Avg Number

Monitor Spectrum or Monitor Band/Channel—Averaging State

[:SENSe]:MONitor:AVERage[:STATe] OFF|ON|0|1
[:SENSe]:MONitor:AVERage[:STATe]?

Turn averaging on or off.

Factory Preset: On for GSM, Bluetooth Off for cdmaOne, Modulation Analysis, Phase Noise and Noise Figure.

Remarks: You must be in the Bluetooth, cdmaOne, GSM, Modulation Analysis, Noise Figure or Phase Noise mode to use this command. Use INSTrument:SELection to set the mode.

Front Panel Access: Meas Setup, Avg Number
Monitor Spectrum or Monitor Band/Channel—Averaging Termination Control

[:SENSe]:MONitor:AVERage:TCONtrol EXPonential|REPeat
[:SENSe]:MONitor:AVERage:TCONtrol?

Select the type of termination control used for the averaging function. This determines the averaging action after the specified number of data acquisitions (average count) is reached.

- **Exponential** - After the average count is reached, each successive data acquisition is exponentially weighted and combined with the existing average.
- **Repeat** - After reaching the average count, the averaging is reset and a new average is started.

**Factory Preset:** Exponential

**Remarks:** You must be in the Bluetooth, cdmaOne, GSM, Modulation Analysis, Noise Figure or Phase Noise mode to use this command. Use INStrument:SELeet to set the mode.

**Front Panel Access:** Meas Setup, Avg Mode

Monitor Spectrum or Monitor Band/Channel—Transmit or Receive Band Selection

*For cdmaOne mode:*

[:SENSe]:MONitor:FBAND TRANsmit|RECeive
[:SENSe]:MONitor:FBAND?

*For GSM mode:*

[:SENSe]:MONitor:BAND TRANsmit|RECeive
[:SENSe]:MONitor:BAND?

Set the band monitor measurement to monitor the transmit or receive band.

**Factory Preset:** TRANsmit

**Remarks:** You must be in the cdmaOne or GSM mode to use this command. Use INStrument:SELeet to set the mode.

**Front Panel Access:** Meas Setup, Band Setup, Band
Monitor Spectrum or Monitor Band/Channel—Band Method Resolution Bandwidth

[:SENSe]:MONitor:BAND:BANDwidth|BWIDth[:RESolution] <freq>
[:SENSe]:MONitor:BAND:BANDwidth|BWIDth[:RESolution]?

Set the value of the resolution bandwidth for the band method of the monitor band/channel measurement. If span is set to a value greater than 5 MHz, minimum resolution bandwidth is limited to 1 kHz.

Factory Preset: 100 kHz for Bluetooth, GSM
300 kHz for cdmaOne

Range:
10 Hz to 5 MHz for GSM
Option 1DR—10 Hz to 5 MHz for Bluetooth
Option 1DR—30 Hz to 3 MHz for cdmaOne
non-Option 1DR—1 kHz to 5 MHz for Bluetooth
non-Option 1DR—1 kHz to 3 MHz for cdmaOne, GSM

Default Unit: Hz

Remarks: You must be in the Bluetooth, cdmaOne, or GSM mode to use this command. Use INSTrument:SELection to set the mode.

Front Panel Access: Meas Setup, Band Setup, Res BW

Monitor Spectrum or Monitor Band/Channel—Band Method Video Bandwidth

[:SENSe]:MONitor:BAND:BANDwidth|BWIDth:VIDeo <freq>
[:SENSe]:MONitor:BAND:BANDwidth|BWIDth:VIDeo?

Set the video bandwidth for the band method of the monitor band/channel measurement.

Factory Preset: 100 kHz for Bluetooth, GSM
300 kHz for cdmaOne

Range:
30 Hz to 3 MHz for Bluetooth
Option 1DR—30 Hz to 3 MHz for cdmaOne, GSM
non-Option 1DR—1 kHz to 3 MHz for cdmaOne, GSM

Default Unit: Hz
Programming Commands
SENSe Subsystem

Remarks: You must be in the Bluetooth, cdmaOne, or GSM mode to use this command. Use INSTRument:SELection to set the mode.

Front Panel Access: Meas Setup, Band Setup, Video BW

Monitor Spectrum or Monitor Band/Channel—Band Method Maximum Hold Trace Average State

[:SENSe]:MONitor:BAND:MAXHold[:STATe] OFF|ON|0|1

[:SENSe]:MONitor:BAND:MAXHold[:STATe]?

Turn maximum hold trace average feature on or off for the band method of the monitor band/channel measurement.

Factory Preset: OFF

Remarks: You must be in the Bluetooth, cdmaOne, or GSM mode to use this command. Use INSTRument:SELection to set the mode.

Front Panel Access: Meas Setup, Band Setup, Max Hold

Monitor Spectrum or Monitor Band/Channel—Channel Span

[:SENSe]:MONitor:CHANnel SINGle|TRIple

[:SENSe]:MONitor:CHANnel?

Switch view between a single or triple channel display.

Factory Preset: SINGle

Remarks: You must be in Bluetooth or GSM mode to use this command. Use INSTRument:SELection to set the mode.

Front Panel Access: Meas Setup, Channel Span

Monitor Spectrum or Monitor Band/Channel—Channel Method Resolution Bandwidth

[:SENSe]:MONitor:CHANnel:BANDwidth|BWIDth[:RESolution]<freq>

[:SENSe]:MONitor:CHANnel:BANDwidth|BWIDth[:RESolution]?

Set the resolution bandwidth for the channel method of the monitor band/channel measurement. If span is set to a value greater than
5 MHz, minimum resolution bandwidth is limited to 1 kHz.
Factory Preset: 10 kHz for GSM
30 kHz for cdmaOne and Modulation Analysis
100 kHz for Bluetooth
Range: Option 1DR—10 Hz to 5 MHz
non-Option 1DR—1 kHz to 5 MHz
Default Unit: Hz
Remarks: You must be in the Bluetooth, cdmaOne, or GSM mode to use this command. Use INStrument:SELection to set the mode.
Front Panel
Access: Meas Setup, Chan Setup, Res BW

Monitor Spectrum or Monitor Band/Channel—Channel Method Video Bandwidth
[:SENSe]:MONitor:CHANnel:BANDwidth|BWIDth:VIDeo <freq>
[:SENSe]:MONitor:CHANnel:BANDwidth|BWIDth:VIDeo?
Set the video bandwidth for the channel method of the monitor band/channel measurement.
Factory Preset:  10 kHz for GSM
               30 kHz for cdmaOne and Modulation Analysis
               100 kHz for Bluetooth
Range:       Option 1DR—30 Hz to 3 MHz
               non-Option 1DR—1 kHz to 3 MHz
Default Unit: Hz
Remarks:     You must be in the Bluetooth, cdmaOne, GSM, or
             Modulation Analysis mode to use this command. Use
             INSTrument:SELect to set the mode.
Front Panel  Access:  Meas Setup, Chan Setup, Video BW

Monitor Spectrum or Monitor Band/Channel—Channel Method
Detector Mode
[:SENSe]:MONitor:CHANnel:DETector POSitive|SAMPle|NEGative
[:SENSe]:MONitor:CHANnel:DETector?
Set the detector mode type for the channel method of the monitor
band/channel measurement.
   POSitive - positive peak detection displays the highest sample taken
during the interval being displayed.
   SAMPl e - sample detection displays the first sample taken during
the interval being displayed.
   NEGative - negative peak detection displays the lowest sample
taken during the interval being displayed.
Factory Preset:  POSitive
Remarks:       You must be in the Bluetooth, cdmaOne, GSM, or
               Modulation Analysis mode to use this command. Use
               INSTrument:SELect to set the mode.
Front Panel  Access:  Meas Setup, Chan Setup, Detector
Monitor Spectrum or Monitor Band/Channel—Channel Method Maximum Hold Trace Average State

[:SENSe]:MONitor:CHANnel:MAXHold[:STATe] OFF|ON|0|1

[:SENSe]:MONitor:CHANnel:MAXHold[:STATe]?

Turn maximum hold trace average feature on or off for the channel method of the monitor band/channel measurement. When max hold is turned on, trace averaging is turned off.

Factory Preset: OFF

Remarks: You must be in the Bluetooth, cdmaOne, GSM, or Modulation Analysis mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel Access: Meas Setup, Chan Setup, Max Hold

Monitor Spectrum or Monitor Band/Channel—Method Selection

[:SENSe]:MONitor:METHod CHANnel|BAND

[:SENSe]:MONitor:METHod?

Sets the monitor measurement method to either channel or band.

Factory Preset: BAND

Remarks: You must be in the Bluetooth, cdmaOne, or GSM mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel Access: Meas Setup, Method
Out of Band Spurious Measurement

Commands for querying the out of band spurious measurement results and for setting to the default values are found in the Measure group of commands. The equivalent front panel keys for the parameters described in the following commands, are found under the Meas Setup key, after the Out Of Band Spurious measurement has been selected from the MEASURE key menu.

Out of Band Spurious—Average Count

[:SENSe]:OOBSpur:AVERage:COUNt <integer>
[:SENSe]:OOBSpur:AVERage:COUNt?

For cdmaOne: Set the number of data acquisitions that will be averaged. After the specified number of average counts, the averaging mode (termination control) setting determines the averaging action.

For GSM: Set the number of max hold data acquisitions that will be averaged per frequency range. The averaging mode (termination control) setting is unavailable for this measurement.

Factory Preset: 10
Range: 1 to 1,000
Remarks: You must be in cdmaOne or GSM mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel Access: Meas Setup, Avg Number

Out of Band Spurious—Averaging State

[:SENSe]:OOBSpur:AVERage[:STATe] OFF|ON|0|1
[:SENSe]:OOBSpur:AVERage[:STATe]?

Turn averaging on or off.

Factory Preset: OFF
Remarks: You must be in cdmaOne or GSM mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel Access: Meas Setup, Avg Number

Out of Band Spurious—Inspect Spur Resolution Bandwidth

[:SENSe]:OOBSpur:BANDwidth[:RESolution] <freq>
[:SENSe]:OOBSpur:BANDwidth[:RESolution]?

...
Set the resolution bandwidth of the out of band spurious measurement. Can only be used when the measurement has completed and Inspect Spur is set to on. ([SENSe]:OOBSpur:ISPur:STATe ON)

Range: 1 kHz to 5 MHz
Default Unit: Hz
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Out of Band Spurious—Inspect Spur Video Bandwidth

[:SENSe]:OOBSpur:BANDwidth:VIDeo <freq>
[:SENSe]:OOBSpur:BANDwidth:VIDeo?

Set the video bandwidth of the out of band spurious measurement. Can only be used when the measurement has completed and Inspect Spur is set to on. ([SENSe]:OOBSpur:ISPur:STATe ON)

Range: 1 kHz to 3 MHz
Default Unit: Hz
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Out of Band Spurious—Inspect Spur Center Frequency

[:SENSe]:OOBSpur:FREQuency[:CENTer] <freq>
[:SENSe]:OOBSpur:FRequency[:CENTer]?

Set the center frequency of the out of band spurious measurement. Can only be used when the measurement has completed and Inspect Spur is set to on. ([SENSe]:OOBSpur:ISPur:STATe ON)

Range: 9 kHz to maximum of current ESA model.
Default Unit: Hz
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.
### Out of Band Spurious—Inspect Spur Frequency Span

```
[:SENSe]:OOBSpur:FREQuency:SPAN <freq>
[:SENSe]:OOBSpur:FREQuency:SPAN?
```

Set the frequency span of the out of band spurious measurement. Can only be used when the measurement has completed and Inspect Spur is set to on. ([SENSe]:OOBSpur:ISPur:STATe ON)

- **Range:** ESA model dependent.
- **Default Unit:** Hz
- **Remarks:** You must be in GSM, EDGE mode to use this command. Use INSTRument:SELect to set the mode.

**Front Panel Access:** SPAN X Scale, Span

### Out of Band Spurious—Inspect Spur

```
[:SENSe]:OOBSpur:ISPur:COUNt <integer>
[:SENSe]:OOBSpur:ISPur:COUNt?
```

Select the spur number that you want to inspect from the table of results. Can only be used when the measurement has completed and Inspect Spur is set to on. ([SENSe]:OOBSpur:ISPur:STATe ON)

- **Remarks:** You must be in GSM, EDGE mode to use this command. Use INSTRument:SELect to set the mode.

**Front Panel Access:** Meas Setup, Inspect Spur, Inspect Spur

### Out of Band Spurious—Inspect Spur

```
[:SENSe]:OOBSpur:ISPur:[STATe] OFF|ON|0|1
[:SENSe]:OOBSpur:ISPur?
```

Set inspect spur on or off. The measurement must have completed and found at least one spur.

- **Factory Preset:** OFF
- **Remarks:** You must be in GSM, EDGE mode to use this command. Use INSTRument:SELect to set the mode.

**Front Panel Access:** Meas Setup, Inspect Spur, Inspect Spur
Out of Band Spurious—MS Idle

[:SENSe]:OOBSpur:MSIDle OFF|ON|0|1
[:SENSe]:OOBSpur:MSIDle?

Set MS idle on to specify that you wish to measure a mobile station that is in idle mode—that is, with no call in progress. The measurement uses filter bandwidth and sweep times according to the specifications. This may involve sweep times of greater than 60 seconds.

Factory Preset: OFF

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel Access: Meas Setup, MS Idle

Out of Band Spurious—Maximum Mixer Level

[:SENSe]:OOBSpur:POWer:MIXer:RANGe[:UPPer] <dB>
[:SENSe]:OOBSpur:POWer:MIXer:RANGe?

Set the maximum power at the input mixer for the out of band spurious measurement.

Factory Preset: 5 dBm

Range: -100 dBm to 10 dBm

Default Unit: dBm

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel Access: Meas Setup, Advanced, Max Mxr Lvl

Out of Band Spurious—Inspect Spur RF Port Input Attenuation

[:SENSe]:OOBSpur:POWer[:RF]:ATTenuation <dB>
[:SENSe]:OOBSpur:POWer[:RF]:ATTenuation?

Set the RF input attenuator. Can only be used when the measurement has completed and Inspect Spur is set to on. ([:SENSe]:OOBSpur:ISPur:STATe ON)

Range: 0 to 75 dB in 5 dB steps for E4402B, E4404B, and E4405B.

0 to 65 dB in 5 dB steps for E4407B.
Programming Commands
SENSe Subsystem

Default Unit: dB
Remarks: You must be in GSM, EDGE mode to use this command.
Use INSTrument:SELection to set the mode.

Front Panel
Access: AMPLITUDE Y Scale, Atten

Out of Band Spurious—Inspect Spur Reference Level

[:SENSe]:OOBSpur:RLEVel <dBm>
[:SENSe]:OOBSpur:RLEVel?

Set the reference level when inspecting spurs. Can only be used when
the measurement has completed and Inspect Spur is set to on.
(:SENSe):OOBSpur:ISPur:STATe ON)

Range: -150 to 150 dBm
Default Unit: dBm
Remarks: You must be in GSM, EDGE mode to use this command.
Use INSTrument:SELection to set the mode.

Front Panel
Access: AMPLITUDE Y Scale, Ref Level

Out Of Band Spurious—Inspect Spur Sweep Time

[:SENSe]:OOBSpur:SWEep:TIME <seconds>
[:SENSe]:OOBSpur:SWEep:TIME?

Change the sweep time when inspecting spurs. Can only be used when
the measurement has completed and Inspect Spur is set to on
(:SENSe):OOBSpur:ISPur:STATe ON).

Factory Preset: 2 s
Range: 4 ms to 500 s
Default Unit: Seconds
Remarks: You must be in GSM, EDGE mode to use this command.
Use INSTrument:SELection to set the mode.

Front Panel
Access: Meas Setup, Inspect Spur, Sweep Time
Reference Oscillator

Reference Oscillator External Frequency

[:SENSe]:OPTion:ROSCillator:EXTernal:FREQuency <freq>
[:SENSe]:OPTion:ROSCillator:EXTernal:FREQuency?

Set the frequency of the external reference oscillator being supplied to the option B7E RF assembly Ext Ref In jack. This provides the proper frequency division in the option B7E RF assembly to achieve the required 10 MHz reference frequency. Switch to the external reference with OPT:ROSC:SOUR.

Preset and *RST: 10 MHz
Range: 1 MHz to 30 MHz
Default Unit: Hz
Front Panel Access: Mode Setup, Demod

Reference Oscillator Rear Panel Output

[:SENSe]:OPTion:ROSCillator:OUTPut[:STATe] OFF|ON|0|1
[:SENSe]:OPTion:ROSCillator:OUTPut?

Set the frequency source for the option B7E RF assembly 10 MHz Out jack to the option reference oscillator.

Preset and *RST: OFF
Front Panel Access: Mode Setup, Demod

Reference Oscillator Source

[:SENSe]:OPTion:ROSCillator:SOURce INTernal|EXTernal
[:SENSe]:OPTion:ROSCillator:SOURce?

Select the reference oscillator (time base) source to the internal reference oscillator or an external oscillator. Use OPT:ROSC:EXT:FREQ to tell the instrument the frequency of the external reference.

INTernal - uses 10 MHz internal time base
EXTernal - uses the signal at the rear panel external reference input port.
Preset and *RST: INTernal
Front Panel Access: Mode Setup, Properties
Output RF Spectrum Measurement

Commands for querying the output RF spectrum measurement results and for setting to the default values are found in the “MEASure Group of Commands” on page 258. The equivalent front panel keys for the parameters described in the following commands, are found under the Meas Setup key, after the Output RF Spectrum measurement has been selected from the MEASURE key menu.

Output RF Spectrum—Number of Bursts Averaged

[:SENSe]:ORFSpectrum:AVERage:COUNt <integer>
[:SENSe]:ORFSpectrum:AVERage:COUNt?

Set the number of bursts that will be averaged. For the output RF spectrum due to switching transients, it is more accurate to consider this the number of frames that are measured. After the specified number of bursts (average counts), the averaging mode (termination control) setting determines the averaging action.

Factory Preset: 10
Range: 1 to 1,000
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Output RF Spectrum—Averaging Control

[:SENSe]:ORFSpectrum:AVERage[:STATe] OFF|ON|0|1
[:SENSe]:ORFSpectrum:AVERage[:STATe]?

Turn averaging on or off.
Factory Preset: ON
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Output RF Spectrum—Averaging Termination Control

[:SENSe]:ORFSpectrum:AVERage:TCONtrol EXPonential|REPeat
[:SENSe]:ORFSpectrum:AVERage:TCONtrol?

Select the type of termination control used for the averaging function. This determines the averaging action after the specified number of frames (average count) is reached.

EXPonential - After the average count is reached, each successive data acquisition is exponentially weighted and combined with the
existing average.

REPeat - After reaching the average count, the averaging is reset and a new average is started.

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELeCt to set the mode.

Factory Preset: REPeat

Output RF Spectrum—Resolution BW For Modulation At Close Offsets

[:SENSe]:ORFSpectrum:BANDwidth[:RESolution] :MODulation:OFFSet:CLOSe <freq>

[:SENSe]:ORFSpectrum:BANDwidth[:RESolution] :MODulation:OFFSet:CLOSe?

Set the resolution bandwidth used for the spectrum due to modulation part of the ORFS measurement for offset frequencies less than 1800 kHz.

Factory Preset: 30 kHz

Range: 1 kHz to 5 MHz

Default Unit: Hz

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELeCt to set the mode.

Output RF Spectrum—Resolution BW for Modulation at Far Offsets

[:SENSe]:ORFSpectrum:BANDwidth[:RESolution] :MODulation:OFFSet:FAR <freq>

[:SENSe]:ORFSpectrum:BANDwidth[:RESolution] :MODulation:OFFSet:FAR?

Set the resolution bandwidth used for the spectrum due to modulation part of the ORFS measurement for offset frequencies greater than or equal to 1800 kHz.

Factory Preset: 100 kHz

Range: 1 kHz to 5 MHz

Default Unit: Hz

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELeCt to set the mode.
Output RF Spectrum—Resolution BW For Switching Transients At Close Offsets

[:SENSe]:ORFSpectrum:BANDwidth[:RESolution]:SWITching:OFFSet:CLOSE <freq>
[:SENSe]:ORFSpectrum:BANDwidth[:RESolution]:SWITching:OFFSet:CLOSE?

Set the resolution bandwidth used for the spectrum due to switching transients part of the ORFS measurement for offset frequencies less than 1800 kHz.

Factory Preset: 30 kHz
Range: 1 kHz to 5 MHz
Default Unit: Hz
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Output RF Spectrum—Resolution BW For Switching Transients At Far Offsets

[:SENSe]:ORFSpectrum:BANDwidth[:RESolution]:SWITching:OFFSet:FAR <freq>
[:SENSe]:ORFSpectrum:BANDwidth[:RESolution]:SWITching:OFFSet:FAR?

Set the resolution bandwidth used for the spectrum due to switching transients part of the ORFS measurement for offset frequencies greater than or equal to 1800 kHz.

Factory Preset: 100 kHz
Range: 1 kHz to 5 MHz
Default Unit: Hz
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Output RF Spectrum—Video BW For Switching Transients At Close Offsets

[:SENSe]:ORFSpectrum:BANDwidth|BWIDth:VIDeo:SWITching:OFFSet:CLOSE <freq>
[:SENSe]:ORFSpectrum:BANDwidth|BWIDth:VIDeo:SWITching:OFFSet:CLOSE?
**SENSe Subsystem**

**Programming Commands**

**t:CLOSE?**

Set the video bandwidth used for the spectrum due to switching transients part of the ORFS measurement for offset frequencies less than 1800 kHz. (Changing this deviates from the GSM standard settings.)

This parameter is only used with the Standard or Short lists, and not with the Custom list.

Factory Preset: 100 kHz

Range: 30 Hz to 3 MHz

Default Unit: Hz

Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

**Output RF Spectrum—Automatic Video BW For Switching Transients At Close Offsets**

[:SENSe]:ORFSpectrum:BANDwidth|BWIDth:VIDeo:SWITching:OFFSe t:CLOSE:AUTO OFF|ON|0|1

Set the video bandwidth to be automatically coupled to the resolution bandwidth. This VBW is used for offset frequencies less than 1800 kHz, for the spectrum due to switching transients part of the ORFS measurement.

Factory Preset: On

Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

**Output RF Spectrum—Video BW For Switching Transients At Far Offsets**

[:SENSe]:ORFSpectrum:BANDwidth|BWIDth:VIDeo:SWITching:OFFSe t:FAR <freq>

[:SENSe]:ORFSpectrum:BANDwidth|BWIDth:VIDeo:SWITching:OFFSe t:FAR?

Set the video bandwidth used for the spectrum due to switching transients part of the ORFS measurement for offset frequencies greater than or equal to 1800 kHz. (Changing this deviates from the GSM standard settings.)

This parameter is only used with the standard or short lists, and not...
with the custom list.

Factory Preset: 100 kHz

Range: 30 Hz to 3 MHz

Default Unit: Hz

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Output RF Spectrum—Automatic Video BW For Switching Transients At Far Offsets

[:SENSe]:ORFSpectrum:Bandwidth|BWIDth:VIDeo:SWITching:OFFSet:FAR:AUTO OFF|ON|0|1

[:SENSe]:ORFSpectrum:Bandwidth|BWIDth:VIDeo:SWITching:OFFSet:FAR:AUTO?

Set the video bandwidth to be automatically coupled to the resolution bandwidth. This VBW is used for offset frequencies greater than or equal to 1800 kHz, for the spectrum due to switching transients part of the ORFS measurement.

Factory Preset: On

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Output RF Spectrum—Burst Synchronization Source

[:SENSe]:ORFSpectrum:BSYNc:SOURce TSEQUence|RFAMplitude|NONE

[:SENSe]:ORFSpectrum:BSYNc:SOURce?

Select the method of synchronizing the measurement to the GSM bursts.

Training Sequence (TSEQUence) - the training sequence burst sync performs a demodulation of the burst and determines the start and stop of the useful part of the burst based on the midamble training sequence.

RFAMplitude - the RF amplitude burst sync approximates the start and stop of the useful part of the burst without digital demodulation of the burst.

NONE - no burst sync is used.

Factory Preset: TSEQUence if both Option B7D (DSP and Fast ADC), and Option B7E (RF Communications Hardware) are
installed.

RFAPplitude if either or both of Option B7D (DSP and Fast ADC), and Option B7E (RF Communications Hardware) are missing.

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Output RF Spectrum—Offset Frequency List

[:SENSe]:ORFSpectrum:LIST:SELect SHORT|STANdard

[:SENSe] :ORFSpectrum:LIST:SELect?

Select the list of frequency offsets and bandwidths to be used to make the ORFS measurement. This command is used only in the ORFS multiple measurement method for both ORFS due to Modulation and ORFS due to Switching Transients.

SHORT - a shortened list of the offset frequencies specified in the GSM Standards. It uses two internal offset frequency lists, one for modulation spectrum and the other for switching transient spectrum. These offset frequencies cannot be changed, but the resolution bandwidths can be changed by other commands in the SENSe:ORFSpectrum subsystem.

STANdard - the complete list of the offset frequencies specified in the GSM Standards, except for those offsets greater than 6 MHz. It uses two internal offset frequency lists, one for modulation spectrum and the other for switching transient spectrum. These offset frequencies cannot be changed, but the resolution bandwidths can be changed by other commands in the SENSe:ORFSpectrum subsystem.

Factory Preset: SHORT

Remarks: This command is only valid if SENS:ORFS:MEAS is set to multiple.

You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Output RF Spectrum—Measure Offsets Measurement Method

[:SENSe]:ORFSpectrum:MEASure MULTiple|SINGle|SWEPt

[:SENSe] :ORFSpectrum:MEASure?

Select the measurement method to be used.

MULTIple - the measurement is done at all offsets in the offset
frequency list.

SINGle - the measurement is done at only one offset as determined by the offset frequency setting. This allows detailed examination of the time-domain waveform at the specified offset frequency.

SWEPt - the measurement is done in the frequency domain. For output RF spectrum due to modulation it is done using time-gated spectrum analysis to sweep the analyzer with the gate turned on for the desired portion of the burst only.

Factory Preset: MULTiple
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.

Output RF Spectrum—Offset Frequency

```
[:SENSe]:ORFSpectrum:OFRequency <freq>
[:SENSe]:ORFSpectrum:OFRequency?
```

Set the offset frequency that is used to measure a single offset. This command is only valid if SENS:ORFS:MEAS is set to single.

Factory Preset: 250 kHz
Range: −6.0 MHz to +6.0 MHz
Step Size: Steps through the values in the selected offset frequency list.
Default Unit: Hz
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.

Output RF Spectrum—Maximum RF Mixer Power

```
[:SENSe]:ORFSpectrum:POWer:MIXer:RANGE[:UPPer] <power>
[:SENSe]:ORFSpectrum:POWer:MIXer:RANGE?
```

Set the attenuation to automatically maintain the specified maximum power level at the RF mixer input.

Factory Preset: 0 dBm
Range: -100 to +10 dBm
Remarks: This is an advanced parameter that has been set up for maximum performance. Using settings greater than 0 dBm could result in a compressed signal or spurious signals or both.
Output RF Spectrum—Reference Power Averages

[:SENSe]:ORFSpectrum:REFerence:AVERage:COUNt <integer>
[:SENSe]:ORFSpectrum:REFerence:AVERage:COUNt?

Set the number of bursts to be averaged when measuring the reference power. Reference power average state must be set to OFF (for further information refer to the next command). Reference power averages is valid only if SENS:ORFS:MEAS is set to single.

Factory Preset: 10

Range: 1 to 1,000

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Output RF Spectrum—Reference Power Average State

[:SENSe]:ORFSpectrum:REFerence:AVERage[:AUTO] OFF|ON|0|1
[:SENSe]:ORFSpectrum:REFerence:AVERage[:AUTO]?

Specifies how many averages to use when measuring the reference power. Set it to ON to use the same number of averages as specified in the number of bursts averaged command. Set it to OFF to use the number specified in the reference power averages command (for further information refer to the previous command). Reference power average state is valid only if SENS:ORFS:MEAS is set to single.

Factory Preset: ON

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Output RF Spectrum—Trigger Source

[:SENSe]:ORFSpectrum:TRIGger:SOURce EXTernal|RFBurst|FRAME|IMMediate
[:SENSe]:ORFSpectrum:TRIGger:SOURce?

Select the trigger source used to control the data acquisitions.

EXTernal - rear panel external trigger input

FRAME - uses the internal frame timer, which has been synchronized to the selected burst sync
IMMediate - the next data acquisition is immediately taken, capturing the signal asynchronously (also called free run)

RFBurst - wideband RF burst envelope trigger that has automatic level control for periodic burst signals

Factory Preset:  RFBurst if the RF Communications Hardware (option B7E) has been installed
                EXTernal if option B7E has not been installed

Remarks:  You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

**Output RF Spectrum—Measurement Type**

[:SENSe]:ORFSpectrum:TYPE MODulation|SWITching
[:SENSe]:ORFSpectrum:TYPE?

Select the measurement type.

MODulation - only the modulation spectrum is measured.

SWITching - only the switching transient spectrum is measured.

Factory Preset:  MODulation

Remarks:  You must be in GSM, EDGE mode to use this command. Use INSTRument:SELect to set the mode.

**Output RF Spectrum—Wideband Noise**

[:SENSe]:ORFSpectrum:WBNoise OFF|ON|0|1
[:SENSe]:ORFSpectrum:WBNoise?

Set wideband noise function to ON or OFF. When set to OFF, the analyzer is tuned to the carrier and -1800 kHz to +1800 kHz either side of the center frequency is swept. When set to ON, the whole of the relevant band 2 MHz either side is swept.

Factory Preset:  OFF

Remarks:  You must be in GSM, EDGE mode to use this command. Use INSTRument:SELect to set the mode.
Phase & Frequency Error Measurement

 Commands for querying the phase and frequency error measurement results and for setting to the default values are found in the “MEASure Group of Commands” on page 258. The equivalent front panel keys for the parameters described in the following commands, are found under the Meas Setup key, after the Phase & Freq measurement has been selected from the MEASURE key menu.

Phase & Frequency Error—Number Of Bursts Averaged

[:SENSe]:PFERror:AVERage:COUNt <integer>

[:SENSe]:PFERror:AVERage:COUNt?

Set the number of bursts that will be averaged. After the specified number of bursts (average counts), the averaging mode (termination control) setting determines the averaging action.

Factory Preset: 15

Range: 1 to 1,000

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Phase & Frequency Error—Averaging State

[:SENSe]:PFERror:AVERage[:STATe] OFF|ON|0|1

[:SENSe]:PFERror:AVERage[:STATe]?

Turn averaging on or off.

Factory Preset: OFF

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Phase & Frequency Error—Averaging Termination Control

[:SENSe]:PFERror:AVERage:TCONtrol EXPonential|REPeat

[:SENSe]:PFERror:AVERage:TCONtrol?

Select the type of termination control used for the averaging function. This determines the averaging action after the specified number of bursts (average count) is reached.

EXPonential - After the average count has been reached, each successive data acquisition is exponentially weighted and combined with the existing average.

REPeat - After reaching the average count, the averaging is reset
and a new average is started.

Factory Preset: EXPonential
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELeCT to set the mode.

Phase & Frequency Error—Averaging Type

[SENSe]:PFError:AVERage:TYPE MEAN|MAXimum
[SENSe]:PFError:AVERage:TYPE?
Select the type of averaging:
  MEAN - the scalar results are averaged.
  MAXimum - the maximum scalar results are retained.
Factory Preset: MAXimum.
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELeCT to set the mode.

Phase & Frequency Error—I/Q Origin Offset Measurement

[SENSe]:PFError:IQOffset [:STATe] OFF|ON|0|1
[SENSe]:PFError:IQOffset [:STATe]?
Turn On or Off I/Q origin offset measurement. If it is set to On, I/Q origin offset is performed. When it is set to Off, the measurement is not performed, but the measurement speed is improved.
Factory Preset: On
  On - I/Q origin offset measurement is performed.
  Off - I/Q origin offset measurement is not performed.
Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTRument:SELeCT to set the mode.

Phase & Frequency Error—Bit Dots State

[SENSe]:PFError:SDOTS [:STATe] OFF|ON|0|1
[SENSe]:PFError:SDOTS [:STATe]?
Set the graphical displays of Phase Error, Phase Error w/Freq and the Constellation Diagram to show (ON) or hide (OFF) the measurement points on the trace.
Factory Preset: ON
Programming Commands
SENSe Subsystem

Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELeCt to set the mode.
This SCPI command is included for completeness, but only affects the traces displayed on the screen.

Phase & Frequency Error—Burst Synchronization

[:SENSe]:PFERror:BSYNc:SOURce TSEQuence|RFAMplitude
[:SENSe]:PFERror:BSYNc:SOURce?

Select the method of synchronizing the measurement to the GSM bursts.

- Training Sequence (TSEQuence) - the training sequence burst sync performs a demodulation of the burst and determines the start and stop of the useful part of the burst based on the midamble training sequence.
- RFAMplitude - the RF amplitude burst sync approximates the start and stop of the useful part of the burst without demodulation of the burst.
- None - no burst synchronization is used

Factory Preset: TSEQuence

Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELeCt to set the mode.

Phase & Frequency Error—Trace Data

[:SENSe]:PFERror:TRACe[:STATe] OFF|ON|0|1
[:SENSe]:PFERror:TRACe[:STATe]?

Turn On or Off trace data for phase and frequency error measurement. If it is set to On, the trace data is available. When it is set to Off, the trace data is not available, but the measurement speed is improved.

Factory Preset: On

- On - Trace data is available.
- Off - Trace data is not available.

Remarks: You must be in the GSM, EDGE mode to use this command. Use INStrument:SELeCt to set the mode.
Phase & Frequency Error—Trigger Source

[SENSe]:PFError:TRIGger:SOURce

EXTernal|FRAMe|IMMediate|RF Burst

[SENSe]:PFError:TRIGger:SOURce?

Select the trigger source used to control the data acquisitions.

  EXTernal - rear panel external trigger input.

  FRAMe - uses the internal frame timer, which has been synchronized to the selected burst sync.

  IMMediate - the next data acquisition is immediately taken, capturing the signal asynchronously (also called free run).

  RF Burst - wideband RF burst envelope trigger that has automatic level control for periodic burst signals.

Factory Preset: RF Burst

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SE lect to set the mode.
RF Power Commands

RF Port Input Attenuation

[:SENSe]:POWer[:RF]:ATTenuation <rel_power>
[:SENSe]:POWer[:RF]:ATTenuation?

Set the RF input attenuator. This value is set at its auto value if RF input attenuation is set to auto.

Factory Preset:  10 dB for SA

5 dB for Bluetooth, cdmaOne, GSM, EDGE, Modulation Analysis

Range:
ESA E4401B, E4411B: 0 to 60 dB for SA
ESA E4402B, E4403B: 0 to 75 dB for SA
ESA E4404B: 0 to 75 dB for SA
ESA E4405B: 0 to 75 dB for SA
ESA E4407B, E4408B: 0 to 65 dB for SA
0 to 75 dB in 5 dB steps for cdmaOne, Modulation Analysis
0 to 65 dB in 5 dB steps for GSM, EDGE

Same range as SA mode, but in 5 dB steps for Bluetooth

Default Unit: dB

Front Panel Access: Input, Input Attenu for Bluetooth, cdmaOne, GSM, EDGE
or Mode Setup, Input, Tab⇒, Input Attenuation for Bluetooth, cdmaOne, GSM, EDGE
or AMPLITUDE/Y Scale, Attenuation for SA, cdmaOne, GSM, EDGE, Modulation Analysis
RF Carriers

[:SENSe]:POWer[:RF]:CARRiers SINGle|MULTiple

[:SENSe]:POWer[:RF]:CARRiers?

Switch between single and multiple carrier modes.

Factory Preset: SINGle

Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

Front Panel Access:

Input, Tab⇒, Input Atten

or

Input/Output, Tab⇒, Input Atten

Internal RF Preamplifier Control

[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF|ON|0|1

[:SENSe]:POWer[:RF]:GAIN[:STATe]?

Turns the internal preamp on or off for the currently selected measurement.

Factory Preset: OFF

Remarks: You must be in GSM, EDGE or Bluetooth mode to use this command. Use INStrument:SELect to set the mode.

Front Panel Access:

AMPLITUDE/Y Scale, Int Preamp for SA

or Mode Setup, Input... for GSM, Bluetooth

or Input, Int Preamp for GSM, Bluetooth

RF Port Power Range

[:SENSe]:POWer[:RF]:RANGe <dBm>

[:SENSe]:POWer[:RF]:RANGe?

Set the maximum total power to be applied at the RF input. There are two modes of operation as follows:

- When RF Port Power Range Auto = AUTO, Max Total Pwr displays the actual measured power level.

- When RF Port Power Range Auto = MANual, the input power range is determined by the manually entered Max Total Pwr value.
Programming Commands
SENSe Subsystem

Range: -100 to +80
Default Unit: dBm
Remarks: You must be in GSM, EDGE or Bluetooth mode to use this command. Use INStrument:SELect to set the mode.

Front Panel Access: Mode Setup, Input....
or
Input, Max Total Pwr

RF Port Power Range Auto
[:SENSe]:POWER [:RF]:RANGe:AUTO OFF|ON|0|1
[:SENSe]:POWER [:RF]:RANGe:AUTO?
Select the RF port power range to be set either automatically or manually.

ON - power range is automatically set as determined by the actual measured power level at the start of a measurement, as displayed by the Max Total Pwr value.

OFF - power range is manually set by either the manually entered Max Total Pwr or Input Atten value.

Factory Preset: ON
Remarks: You must be in GSM, EDGE or Bluetooth mode to use this command. Use INStrument:SELect to set the mode.

Front Panel Access: Mode Setup, Input....
or
Input, Max Total Pwr
Power Steps Measurement (PST)

Commands for querying the power steps measurement results and for setting to the default values are found in the “MEASure Group of Commands” on page 258. The equivalent front panel keys for the parameters described in the following commands, are found under the Meas Setup key, after the Power Steps measurement has been selected from the Measure key menu.

Power Steps—Resolution Bandwidth

```
[:SENSe]:PSTeps:BANDwidth|BWIDth[:RESolution] <freq>
[:SENSe]:PSTeps:BANDwidth|BWIDth[:RESolution]?
```

Set the resolution bandwidth to be used to make the power steps measurement over.

Factory Preset: 1 MHz

Range: 10 Hz to 5 MHz

Default unit: Hz

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Power Steps—Video Bandwidth

```
[:SENSe]:PSTeps:BANDwidth|BWIDth:VIDeo <freq>
[:SENSe]:PSTeps:BANDwidth|BWIDth:VIDeo?
```

Set the video bandwidth to be used to make the power steps measurement over.

Factory Preset: 300 kHz

Range: 30 Hz to 3 MHz

Default unit: Hz

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Power Steps—Sweep Time

```
[:SENSe]:PSTeps:SWEep:TIME <integer>
[:SENSe]:PSTeps:SWEep:TIME?
```

Set the sweep time that will be used to make the power steps measurement over. The value should be set to ≥ 2 seconds to ensure that the GSM modulation does not affect the trace.
Programming Commands

SENSe Subsystem

Factory Preset: 2
Range: 5 ms to 4000 s
Default unit: Seconds
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELet to set the mode.
Power vs. Time Measurement

Commands for querying the power versus time measurement results and for setting to the default values are found in the “MEASure Group of Commands” on page 258. The equivalent front panel keys for the parameters described in the following commands, are found under the Meas Setup key, after the Pwr vs Time measurement has been selected from the MEASURE key menu.

Power vs. Time—Number of Bursts Averaged

[SENSe]:PVTime:AVERage:COUNt <integer>

[SENSe]:PVTime:AVERage:COUNt?

Set the number of bursts that will be averaged. After the specified number of bursts (average counts), the averaging mode (termination control) setting determines the averaging action.

Factory Preset:  15
Range:  1 to 1,000
Remarks:  You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Power vs. Time—Averaging State

[SENSe]:PVTime:AVERage[:STATe] OFF|ON|0|1

[SENSe]:PVTime:AVERage[:STATe]?

Turn averaging on or off.

Factory Preset:  ON
Remarks:  You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Power vs. Time—Averaging Termination Control

[SENSe]:PVTime:AVERage:TCONtrol EXPonential|REPeat

[SENSe]:PVTime:AVERage:TCONtrol?

Select the type of termination control used for the averaging function. This specifies the averaging action after the specified number of bursts (average count) is reached.

EXPonential - After the average count has been reached, each successive data acquisition is exponentially weighted and combined with the existing average.

REPeat - After reaching the average count, the averaging is reset
and a new average is started.

Factory Preset: EXPonential

Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTRument:SELect to set the mode.

**Power vs. Time—Averaging Type**

`:SENSe]:PVTime:AVERage:TYPE LPOWer|POWer
`:SENSe]:PVTime:AVERage:TYPE?`

Select the type of averaging to be performed.

- LPOWer - logarithmically averages the power of the video data.
- POWer - averages the linear power of successive measurements.

Factory Preset: POWer

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELect to set the mode.

**Power vs. Time—Resolution BW**

`:SENSe]:PVTime:BANDwidth|BWIDth[:RESolution] <freq>
`:SENSe]:PVTime:BANDwidth|BWIDth[:RESolution]?`

Set the resolution bandwidth. This is an advanced control that normally does not need to be changed. Setting this to a value other than the factory default, may cause invalid measurement results.

Factory Preset: 300 kHz

Range: 1 kHz to 5 MHz

Default Unit: Hz

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELect to set the mode.

**Power vs. Time—Video BW**

`:SENSe]:PVTime:BANDwidth|BWIDth:VIDeo <freq>
`:SENSe]:PVTime:BANDwidth|BWIDth:Video?`

Specify the video bandwidth.

Factory Preset: 300 kHz

Range: 1 Hz to 3 MHz
Power vs. Time—Burst Synchronization Source

[:SENSe]:PVTime:BSYNc:SOURce TSEQuence|RFAMplitude|NONE
[:SENSe]:PVTime:BSYNc:SOURce?

Select the method of synchronizing the measurement to the GSM bursts.

Training Sequence (TSEQuence) - the training sequence burst sync performs a demodulation of the burst and determines the start and stop of the useful part of the burst based on the midamble training sequence.

RFAMplitude - performs burst synchronization based on the rising and falling edges of the burst.

NONE - performs no burst synchronization.

Factory Preset: TSEQuence

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Power vs. Time—Current Data Calculation

[:SENSe]:PVTime:CDATa OFF|ON|0|1
[:SENSe]:PVTime:CDATa?

Turn calculation of current data results on or off. Current data is calculated at the end of each sweep and is based only on that sweep.

Factory Preset: ON

Range: ON/OFF

Remarks: Set the parameter to OFF to gain additional measurement speed over averaged results.

You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Power vs. Time—Limit Mask Display

[:SENSe]:PVTime:LIMit:MASK OFF|ON|0|1
[:SENSe]:PVTime:LIMit:MASK?

Default Unit: Hz

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.
Programming Commands
SENSe Subsystem

Show or hide the limit mask. Does not affect the pass/fail calculation for limit tests.
Factory Preset: ON
Remarks: You must be in GSM, EDGE, 1xEV-DO, or W-CDMA mode to use this command. Use INStrument:SELect to set the mode.

Power vs. Time—Limit Line Mask Test

[:SENSe]:PVTime:LIMIT:TEST OFF | ON | 0 | 1
[:SENSe]:PVTime:LIMIT:TEST?
Turn on or off limit pass/fail testing. Does not affect limit line display.
Factory Preset: ON
Range: ON/OFF
Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

Power vs. Time—Lower Mask Absolute Amplitude Levels

[:SENSe]:PVTime:MASK:LIST:LOWer:ABSolute <power>, <power>, <power>, <power>, <power>
[:SENSe]:PVTime:MASK:LIST:LOWer:ABSolute?
Enter a power level for any of your mask line segments that require an absolute minimum power limit in addition to its relative limit. Each time a measurement is made the Ref Level is determined. (This is the power level of the useful part of the burst, or midway between the upper/lower masks). Remember, as the power of the Ref Level changes, all of the relative mask power levels will change by the same amount.
Each relative limit is then compared to the Ref Level and an equivalent absolute power level is calculated. This power level is compared to the specified absolute limit for each line segment. If this calculated relative limit is lower then the absolute limit you’ve specified, then the value of the absolute limit is used for this segment. Therefore, if the absolute limit is set to a very low value (−200 dBm), the calculated value of the reference limit will never be lower, and the specified relative limit will always be used for that segment. See Figure 4-2 on page 372.

Every time point you defined with PVT:MASK:LOW:TIME must have a power value defined in the same order. You can put a comma in the SCPI command as a place holder for any points where an absolute power is not specified, and that segment will then use the default value.

Factory Preset: Selected GSM standard

Range: −200 dBm to +100 dBm

Default Unit: dBm

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.

**Power vs. Time—Lower Mask Points**

[:SENSe]:PVTime:MASK:LIST:LOWer:POINts?

Query the number of elements in the lower mask. This value is determined by the number of time points entered using [:SENSe]:PVTime:MASK:LIST:LOWer:TIME.

Range: Integer, 1 to 25

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.

**Power vs. Time—Lower Mask Relative Amplitude Levels**

[:SENSe]:PVTime:MASK:LIST:LOWer:RELative <rel_power>, <rel_power>, <rel_power>, <rel_power>, <rel_power>

[:SENSe]:PVTime:MASK:LIST:LOWer:RELative?

Enter the relative power level for each horizontal line segment in the lower limit mask. There should be a power level for each time point entered using [:SENSe]:PVTime:MASK:LIST:LOWer:TIME, and they must be entered in the same order. These power levels are all relative to the defined Reference Power Level (the average power in the useful part of the data). When an upper and lower limit masks have been defined, the Reference Power Level is the mid-point between these two limits at time t₀.
Programming Commands

SENSe Subsystem

Factory Preset: Selected GSM standard
Range: −100 to 200 dB relative to the reference power
Default Unit: dB
Remarks: You must be in GSM, EDGE, 1xEV-DO, or W-CDMA mode to use this command. Use INSTRument:SELeCT to set the mode.

Power vs. Time—Lower Mask Time Points

[:SENSe]:PVTime:MASK:LIST:LOWer:TIME <seconds>{, <seconds>}
[:SENSe]:PVTime:MASK:LIST:LOWer:TIME?

Enter the time points that define the horizontal line segments of the lower limit. A reference point designated “t₀” is at the center of the useful data (usually the center of the burst). Each line segment to the right of the t₀ reference point is designated as a positive time value and each segment to the left of t₀ is a negative time value.

First enter positive values in sequence starting from t₀, then negative values in sequence starting from t₀. See Figure 4-2 on page 372 and the PVT:MASK:LIST:UPPer:TIME example below it. (This is an upper mask example, but they work the same.)

We recommend that you select a large time value for your first and last mask points (e.g. −1 and +1 second). This guarantees that you’ve defined a limit for all the measured data. (See Mask Segments 4 and 9 in the Table on page 372 for an example.

Factory Preset: Selected GSM standard
Range: −1s to +1s, referenced to t₀ at the center of the useful data (burst center)
1 to 25 time points in a mask
Default Unit: seconds
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTRument:SELeCT to set the mode.

Power vs. Time—Upper Mask Absolute Amplitude Levels

[:SENSe]:PVTime:MASK:LIST:UPPer:ABSolute <power>, <power>, <power>, <power>, <power>
[:SENSe]:PVTime:MASK:LIST:UPPer:ABSolute?

Enter a power level for any of your mask line segments that require an
absolute minimum power limit in addition to its relative limit. Each time a measurement is made the Ref Level is determined. (This is the power level of the useful part of the burst, or midway between the upper/lower masks). Remember, as the power of the Ref Level changes, all of the relative mask power levels will change by the same amount.

Each relative limit is then compared to the Ref Level and an equivalent absolute power level is calculated. This power level is compared to the specified absolute limit for each line segment. If this calculated relative limit is lower then the absolute limit you’ve specified, then the value of the absolute limit is used for this segment. Therefore, if the absolute limit is set to a very low value (−200 dBm), the calculated value of the reference limit will never be lower, and the specified relative limit will always be used for that segment. See Figure 4-2 on page 372.

Every time point you defined with PVT:MASK:LOW:TIME must have a power value defined in the same order. You can put a comma in the SCPI command as a place holder for any points where an absolute power is not specified, and that segment will then use the default value.

Factory Preset:  Selected GSM standard
Range:  -200 dBm to +100 dBm
Default Unit:  dBm
Remarks:  You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

**Power vs. Time—Upper Mask Points**

[::SENSe]:PVTime:MASK:LIST:UPPer:POINts?

Query the number of elements in the upper mask. This value is determined by the number of time points entered using [::SENSe]:PVTime:MASK:LIST:UPPer:TIME.

Range:  integer, 1 to 25
Remarks:  You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

**Power vs. Time—Upper Mask Relative Amplitude Levels**

[::SENSe]:PVTime:MASK:LIST:UPPer:RELative <rel_power>, <rel_power>, <rel_power>, <rel_power>, <rel_power>, <rel_power>, <rel_power>, <rel_power>, <rel_power>, <rel_power>

[::SENSe]:PVTime:MASK:LIST:UPPer:RELative?
Enter the relative power level for each horizontal line segment in the upper limit mask. There should be a power level for each time point entered using [:SENSe]:PVTime:MASK:LIST:UPPer:TIME, and they must be entered in the same order. These power levels are all relative to the defined Reference Power Level (the average power in the useful part of the data). When an upper and lower limit masks have been defined, the Reference Power Level is the mid-point between these two limits at time $t_0$. See Figure 4-2 on page 372.

### Programming Commands

#### SENSE Subsystem

#### Example:

```
PVT:MASK:LIST:UPP:REL
4,-32,-48,100,4,7,-25,-43,100
```

Factory Preset: Selected GSM standard
Range: \(-100\) to \(+200\) dB relative to the reference power
Default Unit: dB
Remarks: You must be in GSM, EDGE, 1xEV-DO, or W-CDMA mode to use this command. Use INSTrument:SELect to set the mode.

### Power vs. Time—Upper Mask Time Points

```
[:SENSe]:PVTime:MASK:LIST:UPPer:TIME
<seconds>, <seconds>, <seconds>, <seconds>, <seconds>
```

```
[:SENSe]:PVTime:MASK:LIST:UPPer:TIME?
```

Enter the time points that define the horizontal line segments of the upper limit. A reference point designated “t₀” is at the center of the useful data (usually the center of the burst). Each line segment to the right of the t₀ reference point is designated as a positive time value and each segment to the left of t₀ is a negative time value.

First enter positive values in sequence starting from t₀, then the negative values in sequence starting from t₀. See Figure 4-2 on page 372 and the PVTime:MASK:LIST:UPPer:TIME example below it.

We recommend that you select a large time value for your first and last mask points (e.g. −1 and +1 second). This guarantees that you’ve defined a limit for all the measured data. (See Mask Segments 4 and 9 in the table Table on page 372 for an example.

Example:

```
PVTime:MASK:LIST:UPPer:TIME 280e-6, 15e-6,
```

---

<table>
<thead>
<tr>
<th>Entered Value for each Time Segment</th>
<th>Absolute Time Value</th>
<th>Relative Power (example with Ref Level = −12 dBm)</th>
<th>Entered Absolute Power (dBm)</th>
<th>Segment Number</th>

SENSe Subsystem

Programming Commands

SENSe Subsystem

450e-6, 1, -270e-6, -10e-6, -20e-6, -450e-6, -1

Factory Preset: Selected GSM standard

Range: −1s to +1s, referenced to \( t_0 \) at the center of the useful data (burst center)
1 to 25 time points in a mask

Default Unit: seconds

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELazyect to set the mode.

Power vs. Time—Custom Limit Masks

[:SENSe]:PVTime:MASK:SELazyect STANdard|CUSTom

[:SENSe]:PVTime:MASK:SELazyect?

Select standard masks or user-defined custom masks to compare you measured data against.

Factory Preset: STANdard

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELazyect to set the mode.

Power vs. Time—Maximum Hold

[:SENSe]:PVTime:MAXHold 0|1|ON|OFF

[:SENSe]:PVTime:MAXHold?

Turn the max hold feature on or off. Available only in monitor view.

Factory Preset: OFF

Range: OFF/ON

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELazyect to set the mode.

Power vs Time - Select Power Control Level

Allows user to indicate the output power of the transmitter; in MS testing transmitter output power level will affect the mask. The appropriate power level for measuring the device under test will correspond with the transmitter power control level setting.

[:SENSe]:PVTime:PCLevel <integer>

[:SENSe]:PVTime:PCLevel?
Range: 0 to 40

Remarks: You must be in the power vs. time measurement in GSM, EDGE mode to use this command. Use INSTRument:SELeCT to set the mode.

Front Panel Access: **Meas Setup, More (1 of 2), Pwr Ctrl Lvl.**

---

**Power vs. Time—Number of Trace Points**

[:SENSe]:PVTime:POINts 401|801|1601|3201|6401

[:SENSe]:PVTime:POINts?

Set the number of trace points used in the measurement.

Factory Preset: 1601

Range: 401, 801, 1601, 3201, 6401

Remarks: The higher the value used here, the more accurate but slower the measurement will be.

More than 801 points are recommended for rise and fall views.

---

**Power vs. Time—Trigger Source**

[:SENSe]:PVTime:TRIGger:SOURce EXTernal|RFBurst|FRAMe

[:SENSe]:PVTime:TRIGger:SOURce?

Select the trigger source used to control the data acquisitions.

- **EXTernal** - rear panel external trigger input
- **FRAMe** - uses the frame timer, which has been synchronized to the selected burst sync.
- **RFBurst** - wideband RF burst envelope trigger that has automatic level control for periodic burst signals.

Factory Preset: RFBurst if the RF Communications Hardware (option B7E) has been installed

- EXTernal, if option B7E has not been installed

Remarks: You must be in GSM, EDGE, Service, 1xEV-DO, or W-CDMA mode to use this command. Use INSTRument:SELeCT to set the mode.
Radio Standards Commands

Radio Device Under Test

[:SENSe]:RADio:DEVice MS|BTS|UBTS1|UBTS2|UBTS3|PBTS1 for GSM
[:SENSe]:RADio:DEVice PC1|PC2|PC3 for Bluetooth
[:SENSe]:RADio:DEVice?

Select the type of radio device to be tested.
Select the power class of the Bluetooth device to be measured. Choices are Power Class 1, 2, or 3.

- MS – Mobile station transmitter test
- BTS – Base station transmitter test
- UBTS1 – Micro base station class M1 transmitter test
- UBTS2 – Micro base station class M2 transmitter test
- UBTS3 – Micro base station class M3 transmitter test
- PBTS1 – Pico base station class P1 transmitter test

Factory Preset: PC1 for Bluetooth

BTS for GSM, EDGE

Remarks: You must be in Bluetooth or GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

Global to current mode.

Front Panel
Access: Mode Setup, Radio, Device

Radio Device Under Test

[:SENSe]:RADio:DEVice:CLASS?

Query the type of device being tested. The two possible results are:
BTS - Base station transmitter test
MS - Mobile station test

Front Panel
Access: Mode Setup, Radio, Device
Radio Standard Band

[:SENSe]:RAdio:STANdard:BAND
PGSM|EGSM|RGSM|DCS1800|PCS1900|GSM450|GSM480|GSM700|GSM850

[:SENSe]:RAdio:STANdard:BAND?

Select the standard variant that applies to the radio to be tested.

- **PGSM** - Primary GSM in the 900 MHz band
- **EGSM** - Extended GSM in the 900 MHz band
- **RGSM** - Railway GSM in the 900 MHz band
- **DCS1800** - DCS1800 band; also known as GSM-1800
- **PCS1900** - PCS1900 band; also known as GSM-1900
- **GSM450** - GSM450 band
- **GSM480** - GSM480 band
- **GSM700** - GSM700 band
- **GSM850** - GSM850 band, for IS-136HS

**Factory Preset:** EGSM900

**Remarks:** Global to the current mode.

You must be in GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

**Front Panel Access:** Mode Setup, Radio, Band
Receiver Spurious Measurement

Commands for querying the receiver spurious responses measurement results and for setting to the default values are found in the “MEASure Group of Commands” on page 258. The equivalent front panel keys for the parameters described in the following commands, are found under the Meas Setup key, after the RX Spur measurement has been selected from the MEASURE key menu.

Receiver Spurious—Average Count

[:SENSe]:RSPur:AVERage:COUNt <integer>
[:SENSe]:RSPur:AVERage:COUNt?

Set the number of data acquisitions that will be averaged. After the specified number of average counts, the averaging mode (termination control) setting determines the averaging action.

Factory Preset: 10
Range: 1 to 1,000
Remarks: You must be in cdmaOne or GSM mode to use this command. Use INStrument:SELect to set the mode.

Front Panel Access: Meas Setup, Avg Number

Receiver Spurious—Averaging State

[:SENSe]:RSPur:AVERage[:STATe] OFF|ON|0|1
[:SENSe]:RSPur:AVERage[:STATe]?

Turn averaging on or off.

Factory Preset: OFF for cdmaOne
ON for GSM
Remarks: You must be in the cdmaOne mode to use this command. Use INStrument:SELect to set the mode.

Front Panel Access: Meas Setup, Avg Number

Receiver Spurious—Averaging Termination Control

[:SENSe]:RSPur:AVERage:TCONtrol EXPonential|REPeat
[:SENSe]:RSPur:AVERage:TCONtrol?

Select the type of termination control used for averaging. This
determines the averaging action after the specified number of data acquisitions (average count) is reached.

EXPonential - After the average count has been reached, each successive data acquisition is exponentially weighted and combined with the existing average.

REPeat - After reaching the average count, the averaging is reset and a new average is started.

Factory Preset: EXPonential

Remarks: You must be in the cdmaOne or GSM mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel
Access: Meas Setup, Avg Mode

Receiver Spurious—Resolution Bandwidth

[:SENSe]:RSPur:BANDwidth|BWIDth[:RESolution] <freq>

[:SENSe]:RSPur:BANDwidth|BWIDth[:RESolution]?

Set the resolution bandwidth that will be used. If span is set to a value greater than 5 MHz, minimum resolution bandwidth is limited to 1 kHz.

Factory Preset: 30 kHz

Range: Option 1DR—10 Hz to 5 MHz
   non- Option 1DR—1 kHz to 5 MHz

Default Unit: Hz

Remarks: You must be in the cdmaOne mode to use this command. Use INSTrument:SELect to set the mode.

Front Panel
Access: Meas Setup, Advanced, Resolution BW

Receiver Spurious—Video Bandwidth

[:SENSe]:RSPur:BANDwidth|BWIDth:VIDeo <freq>

[:SENSe]:RSPur:BANDwidth|BWIDth:VIDeo?

Set the video bandwidth that will be used.

Factory Preset: 3 kHz

Range: Option 1DR—30 Hz to 3 MHz
   non- Option 1DR—1 kHz to 3 MHz
Programming Commands
SENSe Subsystem

Default Unit: Hz

Remarks: You must be in the cdmaOne mode to use this command. Use INStrument:SELect to set the mode.

Front Panel Access: Meas Setup, Advanced, Video BW
Synchronization Commands

Sync Alignment

[:SENSe]:SYNC:ALIGNment GSM|HALF
[:SENSe]:SYNC:ALIGNment?
Select the sync alignment to be either to the GSM standard or the standard offset by 1/2 bit.

GSM - burst alignment as defined in the GSM standard
HALF - burst alignment is advanced by 1/2 bit, which corresponds to an earlier interpretation of the GSM standard

Factory Preset: GSM
Remarks: Global to the current mode.
You must be in the GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

Front Panel
Access: Mode Setup, Demod, Burst Align

Sync Burst RF Amplitude Delay

[:SENSe]:SYNC:BURSt:RFAMplitude:DELay <time>
[:SENSe]:SYNC:BURSt:RFAMplitude:DELay?
Set the delay for the RF amplitude sync.

Factory Preset: 0 s
Range: -5 ms to 5 ms
Default Unit: seconds
Remarks: Global to the current mode.
You must be in Bluetooth or GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

Front Panel
Access: Mode Setup, Trigger, RF Sync Delay
Burst Search Threshold

[:SENSe]:SYNC:BURSt:STHReshold <rel_power>
[:SENSe]:SYNC:BURSt:STHReshold?

Set the power threshold, relative to the peak power, that is used to determine the burst rising edge and falling edge.

Factory Preset: –10 dB
–3.00 dB for Bluetooth
–20 dB for Modulation Analysis and GSM

Range: –200 to –0.01 dB
–50.00 to –0.01 dB for Bluetooth

Default Unit: dB

Remarks: You must be in Bluetooth or GSM, EDGE mode to use this command. Use INStrument:SELect to set the mode.

Front Panel Access: Mode Setup, Demod....
or
Det/Demod, Burst Search Threshold
Transmit Band Spurs Measurement

Commands for querying the transmit band spurs measurement results and for setting to the default values are found in the “MEASure Group of Commands” on page 258. The equivalent front panel keys for the parameters described in the following commands, are found under the Meas Setup key, after the TxBand Spur measurement has been selected from the MEASURE key menu.

Transmit Band Spurs—Average Count

[:SENSe]:TSPur:AVERage:COUNt <integer>

[:SENSe]:TSPur:AVERage:COUNt?

Set the number of data acquisitions that will be averaged. After the specified number of average counts, the averaging is reset and a new average is started.

Factory Preset: 10

Range: 1 to 1,000

Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.

Transmit Band Spurs—Averaging State

[:SENSe]:TSPur:AVERage[:STATe] OFF|ON|0|1

[:SENSe]:TSPur:AVERage[:STATe]?

Turn averaging on or off.

Factory Preset: ON

Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.

Transmit Band Spurs—Idle Mode

[:SENSe]:TSPur:IDLE OFF|ON|0|1

[:SENSe]:TSPur:IDLE?

Set idle mode to YES if the transmitter is set to idle, or NO if the transmitter has an active channel.

Factory Preset: NO

Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.
Transmit Band Spurs—Type

[:SENSe]:TSPur:TYPE EXAMine|FULL
[:SENSe]:TSPur:TYPE?

Select the measurement type.

EXAMine - measures spurs in all the valid segments and then displays the segment that has the worst spur

FULL - continuously measures the spurs in all the valid segments

Factory Preset: FULL

Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.
Transmit Power Measurement

Commands for querying the transmit power measurement results and for setting to the default values are found in the “MEASure Group of Commands” on page 258. The equivalent front panel keys for the parameters described in the following commands, are found under the Meas Setup key, after the Transmit Power measurement has been selected from the MEASURE key menu.

Transmit Power—Number of Bursts Averaged

[:SENSe]:TXPower:AVERage:COUNt <integer>
[:SENSe]:TXPower:AVERage:COUNt?

Set the number of bursts that will be averaged. After the specified number of bursts (average counts), the averaging mode (termination control) setting determines the averaging action.

Factory Preset: 10
Range: 1 to 10,000
Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Transmit Power—Averaging State

[:SENSe]:TXPower:AVERage[:STATe] OFF|ON|0|1
[:SENSe]:TXPower:AVERage[:STATe]?

Turn averaging on or off.

Factory Preset: ON
Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Transmit Power—Averaging Termination Control

[:SENSe]:TXPower:AVERage:TCONtrol EXPonential|REPeat
[:SENSe]:TXPower:AVERage:TCONtrol?

Select the type of termination control used for the averaging function. This determines the averaging action after the specified number of frames (average count) is reached.

EXPonential - After the average count has been reached, each successive data acquisition is exponentially weighted and combined with the existing average.

REPeat - After reaching the average count, the averaging is reset
and a new average is started.

Factory Preset: EXponential

Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.

Transmit Power—Averaging Type

[:SENSe]:TXPower:AVERage:TYPE LPOWer|POWer

[:SENSe]:TXPower:AVERage:TYPE?

Select the type of averaging to be performed.

- LPOWer - logarithmically averages the power of the video data.
- POWer - averages the linear power of successive measurements.

Factory Preset: POWer

Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.

Transmit Power—Resolution BW

[:SENSe]:TXPower:BANDwidth|BWIDth[:RESolution] <freq>

[:SENSe]:TXPower:BANDwidth|BWIDth[:RESolution]?

Set the resolution BW. This is an advanced control that normally does not need to be changed. Setting it to a value other than the factory default, may cause invalid measurement results.

Factory Preset: 300 kHz

Range: 1 kHz to 5 MHz

Default Unit: Hz

Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELection to set the mode.

Transmit Power—Video Bandwidth

[:SENSe]:TXPower:BANDwidth|BWIDth:VIDeo <freq>

[:SENSe]:TXPower:BANDwidth|BWIDth:VIDeo?

Specify the video bandwidth.

Factory Preset: 300 kHz

Range: 1 Hz to 3 MHz
Default Unit: Hz
Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELeet to set the mode.

Transmit Power—Burst Synchronization Source

[:SENSe]:TXPower:BSYNc:SOURce TSEQuence|RFAMplitude|NONE
[:SENSe]:TXPower:BSYNc:SOURce?
Select the method of synchronizing the measurement to the GSM bursts.

TSEQuence - the training sequence burst sync performs a demodulation of the burst and determines the start and stop of the useful part of the burst based on the midamble training sequence.

RFAMplitude - the RF amplitude burst sync approximates the start and stop of the useful part of the burst without digital demodulation of the burst.

NONE - performs no burst synchronization.

Factory Preset: NONE
Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELeet to set the mode.

Transmit Power—Current Data Calculation

[:SENSe]:TXPower:CDATa OFF|ON|0|1
[:SENSe]:TXPower:CDATa?
Turns calculation of current data calculation on or off. Current data is calculated at the end of each sweep and is based only on that sweep.

Factory Preset: ON
Range: ON/OFF
Remarks: You must be in GSM, EDGE mode to use this command. Use INStrument:SELeet to set the mode.

Transmit Power—Maximum Timeslots

[:SENSe]:TXPower:MTIMe <num timeslots>
[:SENSe]:TXPower:MTIMe?
Sets the number of timeslots to capture and show on screen.
Programming Commands
SENSe Subsystem

Factory Preset: 1
Range: 1 to 8
Remarks: You must be in GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Transmit Power—Threshold Level

[:SENSe]:TXPower:THReshold <power>
[:SENSe]:TXPower:THReshold?

Set the amplitude threshold level. Only the data above the threshold level is kept and used to compute the average transmit carrier power.

Factory Preset: −6.0 dB
Range: −60 dB to 0 dB, for relative mode
       −60 dBm to +60 dBm, for absolute mode
Default Unit: dB for relative mode
             dBm for absolute mode
Remarks: The command (SENSe:TXPower:THReshold:TYPe ABSolute|RELative) determines whether this command is setting an absolute or a relative power level.

You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.

Transmit Power—Threshold Type

[:SENSe]:TXPower:THReshold:TYPE ABSolute|RELative
[:SENSe]:TXPower:THReshold:TYPE?

Select auto or manual control of the threshold level.

   ABSolute - threshold value is set to an absolute power level
   RELative - threshold value is set relative to the reference

Factory Preset: RELative
Remarks: You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.
**Transmit Power—Trigger Source**

[:SENSe]:TXPower:TRIGger:SOURce IMMEDIATE|EXTERNAL|RFBURST|FRAME

[:SENSe]:TXPower:TRIGger:SOURce?

Select the trigger source used to control the data acquisitions.

- **EXTERNAL** - rear panel external trigger input
- **IMMEDIATE** - the next data acquisition is immediately taken (also called free run)
- **RFBURST** - wideband RF burst envelope trigger that has automatic level control for periodic burst signals.
- **FRAME** - uses the frame timer, which has been synchronized to the selected burst sync.

**Factory Preset:** RFBurst if the RF Communications Hardware (option B7E) has been installed

- EXTERNAL if option B7E has not been installed

**Remarks:** You must be in the GSM, EDGE mode to use this command. Use INSTrument:SELect to set the mode.
STATus Subsystem

The STATus subsystem controls the SCPI-defined instrument-status reporting structures. Each status register has a set of five commands used for querying or masking that particular register.

Operation Register

Operation Condition Query

:STATus:OPERation:CONDition?

This query returns the decimal value of the sum of the bits in the Status Operation Condition register.

NOTE

The data in this register is continuously updated and reflects the current conditions.

Key Type: There is no equivalent front panel key.

Operation Enable

:STATus:OPERation:ENABLE <integer>

:STATus:OPERation:ENABLE?

This command determines which bits in the Operation Event register, will set the Operation Status Summary bit (bit 7) in the Status Byte Register. The variable <number> is the sum of the decimal values of the bits you want to enable.

NOTE

The preset condition is to have all bits in this enable register set to 0. To have any Operation Events reported to the Status Byte Register, one or more bits need to be set to 1.

Key Type: There is no equivalent front panel key.

Factory Preset:

Range: 0 to 32767
Operation Event Query

:STATus:OPERation[:EVENt]?

This query returns the decimal value of the sum of the bits in the Operation Event register.

**NOTE**

The register requires that the associated PTR or NTR filters be set before a condition register bit can set a bit in the event register.

The data in this register is latched until it is queried. Once queried, the register is cleared.

Key Type: There is no equivalent front panel key.

Operation Negative Transition

:STATus:OPERation:NTRansition <integer>

:STATus:OPERation:NTRansition?

This command determines which bits in the Operation Condition register will set the corresponding bit in the Operation Event register when the condition register bit has a negative transition (1 to 0). The variable <number> is the sum of the decimal values of the bits that you want to enable.

Key Type: There is no equivalent front panel key.

Factory Preset: 0

Range: 0 to 32767

Operation Positive Transition

:STATus:OPERation:PTRansition <integer>

:STATus:OPERation:PTRansition?

This command determines which bits in the Operation Condition register will set the corresponding bit in the Operation Event register when the condition register bit has a positive transition (0 to 1). The variable <number> is the sum of the decimal values of the bits that you want to enable.

Key Type: There is no equivalent front panel key.

Factory Preset: 32767 (all 1’s)

Range: 0 to 32767
The Trigger Subsystem is used to set the controls and parameters associated with triggering the data acquisitions. Other trigger-related commands are found in the INITiate and ABORt subsystems.

The trigger parameters are global within a selected Mode. The commands in the TRIGger subsystem set up the way the triggers function, but selection of the trigger source is made from each measurement. There is a separate trigger source command in the SENSE:<meas> subsystem for each measurement. The equivalent front panel keys for the parameters described in the following commands, can be found under the Mode Setup, Trigger key.

**External Trigger Delay**

:TRIgger[:SEQuence]:EXTERN:DELay <time>

:TRIgger[:SEQuence]:EXTERN:DELay?

Set the trigger delay when using an external trigger. Set the trigger value to zero (0) seconds to turn off the delay.

Factory Preset: 0.0 s

Range: 0 ns to 429 s Anything less than 300 ns is equal to off, for SA

-5 ms to +5 ms, for GSM, EDGE, Bluetooth

Default Unit: seconds

Front Panel Access: Mode Setup, Trigger....

or Trig, External, Delay

**Frame Trigger Delay**

:TRIgger[:SEQuence]:FRAME:DELay <time>

:TRIgger[:SEQuence]:FRAME:DELay?

Set trigger delay to be used in zero span measurements to adjust the active burst within a mask. Use positive values to achieve trigger delay (that is, to measure later than the trigger source event) and use negative values to achieve pre-trigger (that is, to measure earlier than the trigger source event).

Factory Preset: 0

Range: -5 ms to +5 ms, for GSM
Range: 0 ns to 429 s Anything less than 300 ns is equal to off.
Default Unit: seconds
Front Panel Access: Mode Setup, Trigger....

or Trig, Tab⇒, Frame Timer Delay

**RF Burst Trigger Delay**

:TRIGger:RFBurst:DElay <time>
:TRIGger:RFBurst:DElay?

Set the trigger delay when using the RF burst (wideband) trigger.

Factory Preset: 0 s
Range: –5 ms to +5 ms
Default Unit: seconds
Front Panel Access: Mode Setup, Trigger....

or Trig, RF Burst, Delay

**RF Burst Trigger Level**

:TRIGger[:SEQuence]:RFBurst:LEVel <rel_power>
:TRIGger:RFBurst:LEVel <dB> for GSM mode
:TRIGger[:SEQuence]:RFBurst:LEVel?

Set the trigger level when using the RF Burst (wideband) Trigger. The value is relative to the peak of the signal. RF Burst is also known as RF Envelope.

Factory Preset: –25.0 dB
Range: –25.0 to 0.0 dB

Remarks: Option B7E: RF Comms Hardware has at least three possible part numbers. Press System, More, Show Hdwr to show your instrument’s RF Comms Hardware and to find out the part number. If the part number is E4401-60087 (the original version), it is important to set the RF Burst Peak Level to an appropriate level that will avoid the AM transitions which can occur during the active part of EDGE signal bursts, and which can lead to mis-triggering of the measurement.
To set the RF Burst Peak level, press Trigger, RF Burst, Peak Level and enter the peak level in dB.

Default Unit: dB

Front Panel Access: Mode Setup, Trigger, Tab⇒, RF Burst Level

or Trig, RF Burst, Peak Level

RF Burst Trigger Slope

:TRIGger:RFBurst:SLOPe NEGative|POSitive

:TRIGger[:SEQuence]:RFBurst:SLOPe?

Set the trigger slope when using the RF Burst (wideband) Trigger.

Factory Preset: Positive

Remarks: You must be in the cdmaOne, cdma2000, W-CDMA mode to use this command. Use :INSTrument:SELect to set the mode.

Front Panel Access: Mode Setup, Trigger, RF Burst, Slope

Front Panel Access: Mode Setup, Trigger....

or Trig, RF Burst, Slope

What are GSM and EDGE?

The Global System for Mobile communication (GSM) digital communications standard defines a voice and data over-air interface between a mobile radio and the system infrastructure. This standard was designed as the basis for a radio communications system. A base station control center (BSC) is linked to multiple base transceiver station (BTS) sites which provide the required coverage.

EDGE (Enhanced Data Rates for GSM Evolution) enhances the GSM standard by implementing a new modulation format and filtering designed to provide higher data rates in the same spectrum. EDGE and GSM signals can be transmitted on the same frequency, occupying different timeslots, and both use existing GSM equipment. EDGE has also been adopted as the basis for IS-136HS.

GSM 450, GSM 480, GSM 850, GSM 900, DCS 1800, and PCS 1900 are GSM-defined frequency bands. The term GSM 900 is used for any GSM system operating in the 900 MHz band, which includes P-GSM, E-GSM, and R-GSM. Primary (or standard) GSM 900 band (P-GSM) is the original GSM band. Extended GSM 900 band (E-GSM) includes all the P-GSM band plus an additional 50 channels. Railway GSM 900 band (R-GSM) includes all the E-GSM band plus additional channels. DCS 1800 is an adaptation of GSM 900, created to allow for smaller cell sizes for higher system capacity. PCS 1900 is intended to be identical to DCS 1800 except for frequency allocation and power levels. The term GSM 1800 is sometimes used for DCS 1800, and the term GSM 1900 is sometimes used for PCS 1900. The following documents detail the standards used when testing:

**Note**

These standards are continually being updated by the communications industry.

The GSM digital communications standard employs an 8:1 Time
Concepts

What are GSM and EDGE?

Division Multiple Access (TDMA) allowing eight channels to use one carrier frequency simultaneously. The 270.833 kbits/second raw bit rate is modulated on the RF carrier using Gaussian Minimum Shift Keying (GMSK).

The standard includes multiple traffic channels, a control channel, and a cell broadcast channel. The GSM specification defines a channel spacing of 200 kHz.

The framing structure for GSM and EDGE measurements is based on a hierarchical system consisting of timeslots, TDMA frames, multiframes, superframes, and hyperframes. One timeslot consists of 156.25 (157) symbol periods including tail, training sequence, encryption, guard time, and data bits. Eight of these timeslots make up one TDMA frame. Either 26 or 51 TDMA frames make up one multiframe. Frames 13 and 26 in the 26 frame multiframe are dedicated to control channel signaling.

These principles of the GSM systems lead to the need for the fundamental transmitter measurements such as:

- Power vs Time - which verifies that the transmitter output power has the correct amplitude, shape, and timing for the TDMA sequence.
- Phase and Frequency Error - which verifies the accuracy of the transmitters 0.3 GMSK modulation process.
- Output RF Spectrum - which verifies that the RF carrier is contained within the designated 200 kHz channel.

Mobile Stations And Base Transceiver Stations

The cellular system includes the following:

- base transceiver stations, referred to as BTS (frequency ranges dependent on the standard; refer to Table 5-1 on page 397)
- mobile stations, referred to as MS (frequency ranges dependent on the standard; refer to Table 5-1 on page 397)

Uplink And Downlink

Uplink is defined as the path from the mobile station to the base transceiver station. Downlink is the path from the base transceiver station to the mobile station.

What Is An ARFCN?

An ARFCN is the Absolute Radio Frequency Channel Number used in
the GSM system. Each RF channel is shared by up to eight mobile stations using Time Division Multiple Access (TDMA). The ARFCN is an integer (in a range dependent on the chosen standard, refer to Table 5-1 on page 397) which designates the carrier frequency.

What Is A Timeslot?

GSM utilizes Time Division Multiple Access (TDMA) with eight time slots per RF channel which allows eight users to use a single carrier frequency simultaneously. Users avoid one another by transmitting in series. The eight users can transmit once every 4.62 ms for 1 timeslot which is 577 µs long. The eight user timeslots are numbered from 0 to 7.

Typically, each 577 µs timeslot has a length of 156.25 bit periods, which consists of 148 data bits and 8.25 guard bits. The 4.62 ms required to cycle through eight timeslots is called a frame. In a TDMA system, the shape of each transmitted burst must be controlled carefully to avoid over-lapping bursts in time.

Wireless Digital communications systems are made up of five parts: a central phone switching system, a microwave or land-line link, a base transceiver station (BTS), an antenna and preamplifier system, and the air interface with the mobile device shown in Figure 5-1. The ESA is designed to verify the satisfactory operation of the base station system which includes the microwave link, the base transceiver station, the antenna and preamplifier system, and the air interface with the mobile device. The measurements in this guide are divided into chapters according to the subsystems that each tests.
The Fault Finding Process

Four key elements, shown in Figure 5-2, can contribute to degraded cell performance:

- **The transmitter** is often described as the hardest working component of the cell site. Linear power amplifiers generate high power radio signals and run at high temperatures. Insufficient heat dissipation in humid climates can cause the transmitters to overheat, or extremes of cold can cause transmitter heat sinks to crack. As a result, specified performance will be degraded, causing low power transmissions, impaired modulation, and poor adjacent channel performance.

- Cables and antennae are directly exposed to the elements. Weather-damaged antennas, cables, and the connectors can further degrade performance. Sometimes a low noise amplifier close to the antenna is used to boost the signal or microwave radio transceivers are used to link the cell site to the communications network. These components are just as exposed to the same harsh environmental conditions making them prone to failure.

- When a mobile site transmits, other radio systems can interfere with the propagated signal resulting in a degraded signal at the cell site receiver. On the journey, interference from other radio systems can degrade the signal. Tall buildings and hills can deflect the signal away from the antenna and signal degradation can result.

**Figure 5-2** Sources Of System Degradation
To help identify which component of the cell site is contributing to performance problems, a fault finding process is needed. Essentially, once the radio signal is modulated and transmitted, it is prone to degradation. The once perfect, error corrected, monitored digital signal, now has all the characteristics of any analog radio signal. What you want to do is ensure its transmission path is clear and presents no barriers that will hinder its performance. Starting at the transmitter, as indicated in Figure 5-3, you need to check that the correct signal is being generated.

You then need to ensure that it passes through the various cables and connectors without degrading its quality. Once transmitted through the antenna, a clear interference free radio band is required to ensure the handset receives the signal correctly. Then in reverse, you need to verify the reception band is clear and the path from the antenna to the receiver presents no obstacles to the radio receiver equipment, which will decode the signal and convert it back into digital data.

When troubleshooting, you need to ask yourself a set of basic questions. The first thing to question is the transmitter operation where the signal originates. If this is operating satisfactorily, then you need to determine that intermediate components are not attenuating the signal. Finally, you need to ensure that maximum power is being transferred into the antenna feed and array. On the receive side, you again need to ensure that maximum power is being transferred from the antenna to the BTS. You also need to ensure that intermediate components do not over-attenuate the received signal.

Figure 5-3  Fault Finding Process
Use Table 5-3 to help determine which measurement to perform when troubleshooting your cell site base transceiver system.

Identifying Interfering Signals

To identify interfering signals, you must first locate them in the GSM frequency band. This is best done by using the Monitor Band measurement. Sensitivity should be optimized to locate and view small interfering signals.

To optimize the spectrum analyzer for best sensitivity when identifying interference signals, three main parameters need to be understood: resolution bandwidth, internal attenuation, and internal pre-amplification:

- **Resolution bandwidth**: Choose the lowest possible resolution bandwidth filter. The noise floor decreases as resolution bandwidth decreases. This is because noise is a broadband signal, and as you reduce resolution bandwidth, less noise reaches the detector. Sweep speed is inversely proportional to the square of the resolution bandwidth and increases as resolution bandwidth decreases. To optimize speed, the smallest span and largest bandwidth possible should be used that still separates the signals and allows visibility of all signals of interest. Using monitor channel reduces the span by focusing on a specific channel instead of an entire band.

- **Attenuation**: Set the internal input attenuator to the least possible amount of attenuation, normally 0 dB. However, if the input signal total power is greater than $-10$ dBm for 0 dB attenuation, the analyzer may generate internal distortion. To determine if the analyzer is internally generating the distorted signals seen on the display, increase the attenuation and see if the displayed signals change in amplitude. If no amplitude change is evident, the distortion is caused by the unit under test and not the analyzer.

- **Noise floor**: Turn on the internal preamplifier (Option 1DS). This will drop the noise floor and allow you to view the signals that were previously below the analyzer noise floor.

Use the procedure shown in the Table on page 406 and the following examples of interfering signals to help you identify the source of interfering signals and achieve the best sensitivity.
CAUTION

Use a simple attenuator test to determine whether displayed distortion components are true input signals or internally generated signals caused by mixer overload. Press **AMPLITUDE, Attenuation**, and ↑ to increase the attenuation. If the amplitude of the suspected signal changes, then it is internally generated. Continue increasing the attenuation until the displayed distortion does not change, then complete the measurement.
Examples of Interference Signals

Use these signal examples to help assess the bandwidth and spectral shape of the interfering signal to determine the type of transmission causing the interference. Best sensitivity is achieved using narrow resolution bandwidths and minimum attenuation with the built-in preamplifier Option 1DS. The resolution bandwidth used must be larger than the signal bandwidth to display the amplitude accurately. As the resolution bandwidth decreases, the amplitude of the broadband signal decreases. Use the settings in the following examples to identify the various signals.

Using Monitor Band/Channel to Look for Interfering Signals

Using Monitor Band and Channel feature can help you quickly identify interfering signals within your transmission and reception bands or channels. Simple visual inspection, peak hold, and markers can help to determine the type of interference that may be causing network problems.

Commercial AM/FM Broadcast Signal

Press MEASURE, More, Monitor Band/Channel, Meas Setup, Method Channel

Figure 5-4 Example Showing an Interfering AM/FM Broadcast Signal

A narrow bandwidth signal within a channel, as shown in Figure 5-4, could be caused by AM/FM channels. In Spectrum Analysis mode use the built-in AM or optional FM (Option BAA) demod to determine the source of the transmission.
Identifying Interfering Signals

Commercial TV Broadcast Signal

Press **MEASURE, More, Monitor Band/Channel, Meas Setup, Method Band**

**Figure 5-5** Example

Screen Showing an Interfering TV Broadcast Signal

An interfering TV signal, as shown in **Figure 5-5**, can quickly be visually verified by its unique spectral characteristics (two large carriers 4 to 6 MHz apart). In Spectrum Analysis mode, use TV Trigger and Picture on Screen, and FM Demodulation (Options BAA and B7B) to determine the transmission source.
GSM Signals

Press MEASURE, More, Monitor Band/Channel, Meas Setup, Method Band

Figure 5-6 Example Screen Showing Interfering GSM Signals

Adjacent interfering GSM signals will have the type of spectral characteristic shown in Figure 5-6.
GSM/PCS Signal

Press MEASURE, More, Monitor Band/Channel, Meas Setup, Method Channel, More, Chan Setup, Max Hold On

Figure 5-7 Example Screen Showing an Interfering GSM/PCS Signal

GSM/PCS networks can cause in-band interference. A GSM signal will have the type of spectral characteristic shown in Figure 5-7.
GMSK Output RF Spectrum (ORFS) Measurement

Purpose

The Output RF Spectrum measurement is GSM's version of adjacent channel power (ACP). Either a single offset is measured with the corresponding trace visible or multiple (up to 15) offsets are measured and a table is displayed. It is also possible to measure output RF spectrum as a swept measurement.

The output RF spectrum measurements determine the spectral energy emitted into the adjacent channels. Since GSM is a TDMA format, RF power is being switched on and off depending on whether the actual burst is being transmitted. The switching of power causes spectral splatter at frequencies other than that being transmitted by the carrier. Fast transitions in the time domain causes switching transients that have high frequency content associated with them.

Excessive amounts of energy spilling into an adjacent frequency channel could interfere with signals being transmitted to other MS or BTS. The measurements are divided into two main groups: spectrum due to the 0.3 GMSK modulation and noise, and spectrum due to switching transients (burst ramping).

NOTE

The default output RF spectrum measurements do not perform tests at frequency offsets greater than 1800 kHz from the carrier.

Measurement Method

In this measurement, the transmitter (source) is set to transmit a GSM frame at a given channel (frequency). The instrument acquires a time record at a particular offset from the channel being transmitted. When the offset is zero, the instrument is said to be measuring the carrier. For a given offset frequency from the carrier, the transmitter must not exceed a certain power level relative to the carrier. The GSM specification defines the offsets and their maximum absolute and relative power levels.

The general steps in making the measurement are as follows:

1. Acquire time record.
2. Measure power of the carrier.
3. Synchronize for gating on the carrier - finds 50% and 90% portion of burst for Spectrum Due to Modulation portion of the test
4. Compare each offset power to reference to get relative power level.
The output RF spectrum measurement consists of the following two measurements:

- **Output RF spectrum due to modulation.**
  For this measurement the average value during at least 40 bits between bit 87 and 132 (approximately equivalent to the 50% to 90% portion of the burst, excluding midamble) is retained. The vertical lines mark the section of the burst over which the measurement is made. If multiple bursts are examined, an average of the average values is calculated. The relative power (difference between the average power of the burst at zero offset and the average power of the burst at the indicated offset) and the absolute power are displayed.

- **Output RF spectrum due to switching transients.**
  For this measurement the peak value of the burst is retained. If multiple bursts are examined, then the maximum of the peak values is retained. The relative power (difference between the peak power of the burst at zero offset and the peak power of the burst at the indicated offset) and the absolute power are displayed.

The GSM standard specifies the tests are run on specified offsets from the carrier. The instrument identifies this as single offset, multiple offset or swept modes. The measurement made in these modes is the same, except for the following:

- **Multiple offset mode automatically makes the measurement at all the specified offset frequencies and lists the results in a table at the end of the measurement.**

- **Swept mode makes the measurement in the frequency domain and shows the GSM burst relative to the limits mask.**
Concepts

Chapter 5 413

GMSK Output RF Spectrum (ORFS) Measurement

Results

Figure 5-8  
Output RF Spectrum (ORFS) Due To Modulation: Single Offset Measurement

Figure 5-8 shows a single offset trace taken during an ORFS due to modulation measurement. The vertical bars show the portion used to measure power due to modulation. If averaging is turned on, the trace is averaged with previous traces using video averaging. The displayed value is the average of points within the vertical bars.

GMSK Phase and Frequency Error Measurement

Purpose

Phase and frequency error measures the modulation quality of GSM systems. Since GSM systems use relative phase to transmit information, phase and frequency accuracy of the GSM transmitter is critical to the system’s performance and ultimately affects range.

GSM receivers rely on the phase and frequency quality of the 0.3 GMSK signal in order to achieve the expected carrier to noise performance. A transmitter with high phase and frequency error can often still support phone calls during a functional test. However, it will tend to provide difficulty for mobiles trying to maintain service at the edges of the cell, with low signal levels or under difficult fading and Doppler conditions.

Measurement Method

The phase error of the test signal is measured by computing the difference between the phase of the transmitted signal and the phase of a theoretically perfect signal.

The instrument samples the transmitter output in order to capture the actual phase trajectory. This is then demodulated and the ideal phase trajectory is mathematically derived. Subtracting one from the other results in an error signal.

There are two ways of showing the measurement results. The I/Q Quad View (Figure 5-14) displays the numeric results and three graphical displays of the same data - Phase Error, Phase Error with Frequency and RF Envelope. The I/Q Measured View (Figure 5-15) displays the numeric results and a graphical display of the I/Q Measured Polar Vector.
Results

Figure 5-14  Phase and Frequency Error Result - I/Q Quad view

Figure 5-15  Phase and Frequency Error Result - I/Q Measured view
GMSK Power Versus Time Measurement

Purpose

Power versus Time measures the mean transmit power during the “useful part” of GSM bursts and verifies that the bursts fit within the defined mask. This can be used to test that other adjacent timeslots are not experiencing interference. Power vs Time also lets you view more than one burst at a time up to an entire frame.

Measurement Method

The Power vs Time measurement provides masks for both BTS (Base Transceiver Station) and MS (mobile station). The timings are referenced to the transition from bit 13 to bit 14 of the midamble training sequence. The 0 dB reference is determined by measuring the mean transmitted power during the “useful part” of the burst. You can also define a user configurable limit mask to apply to the measured burst.

The GSM specification defines the “useful part” of the normal GSM burst as being the 147 bits centered on the transition from bit 13 to bit 14 of the midamble (the “T0” time point).

The instrument acquires a GSM signal in the time domain. The “T0” point and the useful part are computed. If Burst Sync is set to Training Seq, a GSM demodulation is performed to find “T0”. If Burst Sync is set to RF Amptd, an approximation of “T0” will be used without performing a demodulation. The average power in the useful part is then computed and displayed, and the GSM limit mask is applied. The measurement displays Pass when the burst fits within the bounds of the mask.
Results

Figure 5-16  Power versus Time Measurement Result - Mask View

Figure 5-17  Power versus Time Measurement Result - Monitor View
Power Steps Measurement

Purpose

The power steps measurement uses long sweep times to display the different power steps resulting from adaptive control. It measures the dynamics of the power step changes. Use the more accurate mean carrier power measurement to make power measurements on carriers with a static power level. The power steps measurement checks the maximum power of all 8 timeslots.

SFH mode is available for this measurement.

An external frame trigger is not required for this measurement.

Measurement Method

Markers are placed on the trace and the marker mode set to delta. The marker delta readings give the difference in amplitude and time between the power levels of the markers.

Averaging is not enabled for the power steps measurement—it is not appropriate due to the long sweep time and manual power stepplings.

Results

An example screen from a Power Steps measurement is shown below in Figure 5-18

![Figure 5-18 Power Steps Measurement](image)
Transmitter Power Measurement

Purpose

Transmitter Power is the measure of in-channel power for GSM systems. Mobile stations and base transceiver stations must transmit enough power, with sufficient modulation accuracy, to maintain a call of acceptable quality without leaking into frequency channels or timeslots allocated for others. GSM systems use dynamic power control to ensure that each link is maintained with minimum power. This gives two fundamental benefits: overall system interference is kept to a minimum and, in the case of mobile stations, battery life is maximized.

The Transmitter Power measurement determines the average power for a RF signal burst at or above a specified threshold value. The threshold value may be absolute, or relative to the peak value of the signal.

At the base transceiver station, the purpose of the Transmitter Power measurement is to determine the power delivered to the antenna system on the radio-frequency channel under test. The Transmitter Power measurement verifies the accuracy of the mean transmitted RF carrier power. This can be done across the frequency range and at each power step.

Measurement Method

The instrument acquires a GSM signal in the time domain. The average power level above the threshold is then computed and displayed. This measurement uses the “power-above-threshold” method instead of the “useful part of the burst” method defined in the GSM standards. The measured Transmitter Carrier Power will be very nearly the same for these two methods. The power-above-threshold method has the advantages of being faster and allows power measurements to be made at somewhat lower power levels. It also has the advantage of not requiring the carrier to have a valid TSC (Training Sequence Code).

Note that this measurement does not provide a way to specify which timeslot is to be measured. Therefore if multiple timeslots are on, they should all be set at the same power level, or the levels of those timeslots to be excluded need to be kept below the threshold level. If you want to measure Transmitter Carrier Power using the GSM specified useful part of the burst method, use the Power vs Time measurement, which also measures the power ramping of the burst.
Concepts

Transmitter Power Measurement

Results

Figure 5-20  Transmitter Power Result - Multiple Bursts
Monitor Band/Channel Measurement

Purpose

This measurement verifies the GSM band and channels are free of interference by measuring the spurious signals in the bands and channels specified by the selected standard and tuning plan.

Measurement Method

This procedure scans the specified band or channels and by placing markers on the trace it is possible to check the band/channels for interference. A Max Hold function enables monitoring over time. This is useful when the interference is intermittent.

Results

Figure 5-21 Monitor Band/Channel Measurement Results—Band Method
Figure 5-22 Monitor Band/Channel Measurement Results—Channel Method
Out-of-Band Spurious Measurement

Purpose

This measurement verifies the operation of the transmitter by measuring the spurious signals created outside of the transmitter band specified by the selected standard and tuning plan.

Measurement Method

This out-of-band spurious measurement first measures the channel power as defined by the selected standard and tuning plan. Then out of band frequencies are scanned and spurious responses are measured in accordance with the standards documents. If a carrier is not present, the measurement runs and the message “Carrier Not Present” is displayed.

Although the standards documents specify that frequencies up to 12.75 GHz are scanned, not all ESA models are equipped to measure at these frequencies. In such cases, frequencies up to the maximum range of the analyzer are used.

---

NOTE

Care needs to be taken if you are making measurements with a carrier power close to or above 30 dBm. We recommend that you use a fixed attenuator and a 1 dB step attenuator and use the step attenuator to optimize the noise floor to the limit line margin.
Figure 5-23  Out-of-Band Spurious Measurement Results

Results are shown in tabular format beneath the trace. To view this section of the window in its entirety, press the Next Window menu key until it is highlighted, then press the Zoom menu key.
Transmitter Receive (Rx) Band Spurious Measurement

Purpose

The receive band spurious measurement checks a transmitter’s receive band for conformance to the ETSI specification:

NOTE  For MS mode, the limits for E-GSM900 and R-GSM900 apply only to the part of the limit that does not overlap with other bands. The P-GSM900 limit takes priority for the upper portion followed by E-GSM900 and then R-GSM900, if appropriate. This means that up to three limits may be in force at once in MS mode.

Measurement Method

The measurement sweeps in the receive band of the current device and checks the trace for any spurs which exceed the maximum permissible transmitter power (shown above in Table 5-4).

</table>

NOTE  Although the Idle Mode parameter has no effect when testing in BTS mode, the parameter should always be set to the relevant setting (Idle Mode = ON or OFF) so that the measurement knows which limit to use.

Measurement Method

The measurement splits the transmit band into four segments (or less if the currently selected ARFCN is at the edge of the band) and allocates analyzer parameters for each segment.

Two measurement modes are provided:

- Full: Each segment is swept and the peak trace point amplitude and frequency stored. The maximum of these peaks is taken as the worst spur and checked against a user definable limit parameter to see whether or not the spur fails the test.

- Examine: A single full measurement is performed, the measurement then parking on the segment containing the worst spur.

NOTE  If the measurement is set to sweep mode single, or if the measurement mode is examine, you can examine each segment individually using the View menu keys.
Concepts
Transmitter Transmit (Tx) Band Spurious Measurement

Making the Measurement

1. Press the Measure key.
2. Press the Tx Band Spur key.

Factory default parameter settings provide a GSM compliant measurement. For special requirements, you may need to change default settings:

- Mode setup and frequency/channel parameters. Use the Mode Setup and Frequency Channel keys to change these parameters for all measurements made within the current mode. For further information refer to Chapter 1 of this document.

- Measurement setup parameters. These are measurement specific parameters changed using the Measurement setup (Meas Setup) menu. Parameters can be returned to default settings at any time by pressing Meas Setup and Restore Meas Defaults.

NOTE
Parameters that exist under the Meas Setup Advanced key seldom need to be changed. Any changes from the default values may result in invalid measurement data.

Results

Figure 5-25 Transmitter Tx Band Spurious Measurement Results
Cable Fault Location Measurements

Purpose
A cable fault location measurement displays the reflected signal of a transmission line as a function of the distance down the line. This complements the return loss measurement described in the next section: if a cable under test fails a return loss measurement, a cable fault location measurement can be used to identify the location of the fault. The measurement is particularly useful when a base station and antenna are connected by a long length of cable.

Trace Points
Changing the number of trace points in the cable fault affects the minimum and maximum measurable distances. As a general rule, the longer the cable, the more trace points you should use. Up to 8192 trace points can be used but due to the computation intensive FFT, the measurement becomes slower as the number of points used increases. To ensure the fastest possible measurement speed, always use a number of trace points equal to the power of 2—for example 512 or 1024.

FFT Windowing Function
The cable fault location measurement uses an FFT to convert the analyzer frequency trace into a distance trace. To get the best results from the FFT you must apply the most suitable windowing function to the frequency trace before performing the FFT. The following table describes the windowing functions available:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Max side-lobe level (dB)</th>
<th>Side-lobe roll off (dB/decade)</th>
<th>Max main (dB)</th>

Return Loss Measurements

NOTE
The return loss (VSWR) measurement is not a “one button” measurement. All steps required to make one is fully detailed in the chapter on making measurements.

Purpose

Some of the energy incident upon a device can be reflected back towards the source. A return loss measurement quantifies this reflected energy. Return loss is used to determine the health of an antenna system and its associated cabling by measuring the amount of transmitted power reflected back from the antenna system and therefore not passed over the air interface to the mobile user.

Cables and antennae are often subjected to harsh weather conditions resulting in a performance which deteriorates over time, leading to an eventual failure. By monitoring return loss over time, cable and antennae performance can be monitored and preventive action taken when required.
Loss/Gain Measurements

NOTE

The loss/gain measurement is not a “one button” measurement. All steps required to make one is fully detailed in the chapter on making measurements.

Purpose

Loss/gain measurements are used to verify the performance of devices or components as illustrated by the following examples:

• A loss measurement can be used to test the performance of a base station’s cables. Lower than expected base station power measurements could be caused by faulty cables. A cable’s role in the problem can be determined by measuring the loss of the cable and comparing the result to the expected value.

• A gain measurement can be used to test the performance of an amplifier. A lower than expected gain measurement could indicate a fault with the amplifier.
6 Menu Maps

This chapter provides a visual representation of the front panel keys and their associated menu keys. For function key descriptions, refer to Chapter 3, “Key Reference.”
What You Will Find In This Chapter
