Delay characteristics

**Aperture frequency**

\[ \text{Aperture frequency} = \frac{200}{N-1} \% \text{ to 100\% of span, where } N \text{ is number of points} \]

**Accuracy** (at 23 ±5 °C, SPC)

In general, the following formula can be used to determine the accuracy, in seconds, of a specific group delay measurement:

\[ \text{Phase accuracy} \left[ \text{deg} \right] = \frac{360 \left[ \text{deg} \right] \times \text{aperture} \left[ \text{Hz} \right]}{\text{sec}} \]

Depending on the aperture, input level, and device length, the phase accuracy used in either incremental phase accuracy or worst case phase accuracy.
