Lab Quality You Can Get a Handle On
The 492 is a high performance, rugged, instrument of compact size, with microprocessor logic control. Full programmability via GPIB (IEEE Standard 488-1978) compatibility is available in the 492P version.

Three-knob operation provides use as simple as 1, 2, 3 through microprocessor coupled functions such as resolution bandwidth, video bandwidth, sweep time, frequency span, RF attenuation, and reference level. Measurement accuracy is enhanced through the use of 0.25 dB mode, which switches in 0.25 dB steps.

Digital storage and processing facilitate trace comparisons and add measurement capability through the Max Hold function for frequency drift and amplitude change measurements. Arithmetic operations can be performed between traces or between a trace and a reference. Digital noise averaging mode results in trace smoothing. With digital storage, the display is steady and without flicker, even at the lowest sweep speeds; plus trace values may be retained as long as power is on.

492P Makes Spectrum Analysis Automatic, and Easy.
Two instruments in one, the 492P is a fully programmable version of the 492 Spectrum Analyzer. It incorporates all of the 492’s lab quality performance and ease of use features when used as a manual instrument. Push the “Reset to Local” button and the 492P becomes a 492—with operation from the front panel. But, most important, the 492P opens the way to automated spectrum analysis and documentation via its IEEE Standard 488 (GPIB) interface. This versatility makes the 492P useful in many applications in the lab, factory or field.

ATE Software Enhances Utility
The NEW TekSPAN® software expands the 492P into a fully automated measurement package for general RF applications. Increase productivity and measurement repeatability of the 492P with a Tek 4041 Controller—or if you prefer your own IBM PC or HP controller. See page 158 for details.

Add Programmability
Programmability/GPIB features can be added to 492 Spectrum Analyzers. This means if you want to delay a programmability/GPIB decision because of budget constraints, or for any other reason, you can convert your 490 Series spectrum analyzer later. Conversions are made at designated Tektronix Service Centers.

Easy to Use
The 492P is designed for ease of operation via the GPIB, just as the 492 is designed for front panel operational ease. Most commands for program control are simply abbreviations of the front panel nomenclature.

The 492P’s high level command language and the similarity of commands and responses simplify programming and make program listings easily readable for editing.
Put it to Work
With the programmable 492P on your measurement team, repetitive measurements can be done the same way every time. Your throughput will increase—as will your confidence in results. And, the internal processing and high level programming language makes software development faster. You get high power results with easy programming. When you look at the total performance capability of the 492P, you’ll recognize its value: ease of operation both as a programmable and manual instrument. Wide frequency range. The versatility to go where you go. Into the lab for automated testing; into the field for data collection.

**CHARACTERISTICS**

The following characteristics and features apply to the 492/492P Spectrum Analyzers after a 30 minute warmup period unless otherwise noted.

**FREQUENCY RELATED**

**Center Frequency Range** — 50 kHz to 21 GHz standard, amplitude specified coverage to 220 GHz with optional Tektronix waveguide mixers.

**Frequency Accuracy** — ± (5 MHz + 20% of span/div) or ± (0.2% of the center frequency + 20% of span/div) whichever is greater after two hour warmup.

**Readout Resolution** — Within 1 MHz.

**Frequency Span/Division Range** — 10 kHz to 500 MHz/div in a 1-2-5 sequence in the 50 kHz to 21 GHz center frequency range. Option 03 provides additional span ranges of 500 MHz, 1 kHz, 2 kHz, and 5 kHz/div.

**Frequency Span/Division Accuracy** — ± 5% of span/div, measured over center eight divisions.

**Resolution Bandwidth (−6 dB Points)** — 1 MHz to 1 kHz (100 Hz for Option 03) in decade steps, plus an Auto position. Resolution is within 20% of selected bandwidth.

**Resolution Shape Factor (60 dB/6 dB)** — 7.5:1 or less.

**Residual FM** — 1 kHz p-p for 2 ms time duration, improves to (50 Hz) for 20 ms with phase lock Option 03.

**Long Term Drift (At Constant Temperature** and Fixed Center Frequency) — 3 kHz/10 minutes after one hour warmup with Option 03 for fundamental mixing.

**Noise Sidebands** — At least —75 dbc at 30X resolution offset from the center frequency (−70 dBc for 100 Hz resolution bandwidth Option 03).

**AMPLITUDE RELATED**

**Reference Level Range** — Full screen, top of graticule -123 dBm to +40 dBm (+40 dBm, includes maximum safe input of +30 dBm and 10 dB gain of IF gain reduction) for 10 dB/div and 2 dB/div log modes. 1 W maximum safe input in the linear mode.

**Reference Level Steps** — 10 dB, 1 dB, and 0.25 dB for relative level (Δ) measurements in Log mode. 1-2-5 sequence and 1 dB equivalent increments in Lin mode. The RF attenuator steps 10 dB for reference level changes above −30 dBm (−20 dBm when minimum noise is active) unless minimum RF attenuation is greater than normal. The IF gain increases 10 dB for each reference level change below −30 dBm (−20 dBm when minimum noise is active).

**Display Dynamic Range** — 80 dB at 10 dB/div, 16 dB at 2 dB/div and eight division in linear mode.

**Reference Level Accuracy** — Accuracy is a function of the following characteristics listed below:

Calibrator: (Cal out) See output signal characteristics.
