New AWG/AFG 2000 Series
The Tektronix AWG 2020 and AFG 2020 Arbitrary Generators combine the function of an arbitrary generator with a controller and a graphical user interface. A built-in high-resolution monitor facilitates waveform definition. The AWG 2020 and AFG 2020 share a common user interface design and monolithic platform. While the basic operation is similar, each unit provides unique benefits. The AWG 2020 is ideal for generating complex waveforms requiring long record lengths—up to 256K. It also includes a built-in 3.5 inch floppy disk to facilitate data storage and waveform transfers. An MS-DOS compatible file management system allows waveform generation and transfer without an external controller for most operations.

The AFG 2020 is ideal for applications requiring both precision functions and limited arbitrary waveform generation. It uses Direct Digital Synthesis (DDS) to generate highly accurate waveforms that can be defined in a 1K record length. It can generate standard sinewaves up to 100 MHz, square waves up to 50 MHz, and triangle, ramp, and pulse waveforms up to 31.2 MHz.

GENERATE A VARIETY OF WAVEFORMS WITHOUT A CONTROLLER
Standard waveforms available include sine, square, triangle, ramp, pulse, and DC. Coupled with flexible triggering, gating, and modulation capabilities, you have complete control over waveform generation. In addition, you can precisely define waveforms using polynomial formula entry of mathematical parameters.

GRAPHICAL USER INTERFACE SIMPLIFIES OPERATION
A unique windows-like graphical user interface (GUI) provides a familiar user environment and simplifies operation. The icon-based GUI features soft-key menu selections. As you enter data to build your waveform, you can view the resultant signal on the integral display.

USE STANDARD WAVEFORMS OR CREATE YOUR OWN
You can use any of several methods to create a new arbitrary waveform. You can select one of the standard waveforms from the library and modify it to produce the desired waveform using the graphical waveform editing tools. Or, waveforms can be acquired with a companion digital oscilloscope (DSO) and transferred to the AWG 2020 or AFG 2020 via the GPIB—an external controller is not required for transfer. A series of waveforms can be executed via the internal DOS-like file manager.

Unique waveforms can be created in exacting detail using the graphical editing features to define waveforms. Or you can use the formula entry mode to precisely define waveforms based upon mathematical equations, timing diagrams, or timing tables.

THE PERFECT COMPANION FOR YOUR TEGTRONIX SCOPE
The AWG 2020 and AFG 2020 feature direct communication with the Tektronix 2200, 2400, and TDS series digital oscilloscopes. Waveforms acquired with these scopes can be transferred to the AFG 2020 or AWG 2020, edited for desired features, and used as testing sequences. All of this can be done without the need for an external controller.

FULLY PROGRAMMABLE VIA GPIB
The AWG 2020 and AFG 2020 are fully programmable via a GPIB interface (IEEE 488.2). As a result, they are ideal additions to provide stimulus and arbitrary waveform generation for your measurement system.
